PURPOSE

This off-site and on-site drainage evaluation was prepared for submittal of a site plan approval submittal package for the proposed Eagle Ranch Market at the southeast corner of State Highway 38 and State Lane in Erwin Lake. This evaluation is being performed to determine if off-site drainage flows that will affect the proposed development and provide a preliminary drainage evaluation for the proposed on-site facilities. All of the developed 100-year on-site generated drainage flows will be retained on-site.

DESCRIPTION OF DRAINAGE AREAS

The subject lot is located at the southeast corner of State Highway 38 State Lane in Erwin Lake. The subject site is irregularly shaped and is approximately 0.9 net acres in size. The site is located near the top of a small ridge with moderately sloping to the northwest.

A field evaluation showed that no off-site natural drainage courses cross the site (see attached Aerial Photo and Off-Site Drainage Area Map). Most of the drainage flows collect along the northeastern site of the state highway and is directed to a culvert that crosses under State Lane. Developed land to the southeast collect on the southeast side of the highway and conducted to a culvert at the intersection. Therefore, little to no off-site flow enters the subject site.

DESCRIPTION OF ON-SITE WATERSHED

The existing site slopes moderately to the northwest and is vacant and undeveloped. The proposed development type will be commercial. The on-site watershed was assumed to have a soil Type "C" per the San Bernardino County Hydrology Manual. The proposed building pads will be elevated above the surrounding proposed driveways and the property adjacent to the state highway. A drainage swale along the rear of the building will conduct any off-site flows trying to enter the site northwesterly to the culvert under State Lane. Drainage swales will be constructed to conduct drainage flows to a storm drain inlet near the northwesterly corner of the proposed site, maintaining the natural pattern of drainage (see attached On-Site Drainage Area Map). Preliminary retention volumes were determined using a simplified hydrograph method. The proposed retention basin capacities exceed the calculated retention volumes generated by collect all of the 100-year on-site drainage flows. A final hydrology study will be needed to establish the exact on-site drainage facilities and the required retention volumes.

SUMMARY

It was determined that off-site drainage flows do not enter the site and the proposed driveway and a drainage swale behind the building will assist in conducting off-site flows northwesterly prior to entering the site. All on-site drainage flows will be collected and directed to an underground retention basin. On-site retention volumes were established by assuming the collection of all on-site 100-year drainage flows and the retention basin capacities exceed those retention volume requirements.
