MANAGEMENT SUMMARY

BCR Consulting LLC (BCR Consulting) is under contract to RGP Planning & Development Services (RGP) to complete a Cultural Resources Assessment of the proposed White Road Solar Photovoltaic Installation Project (project) in San Bernardino County, California. The project occupies 47 acres and is bounded by Nielson Road on the north, Muscatel Street on the South, White Road on the east, and Pueblo Trail on the west. A cultural resources records search, additional research, intensive-level pedestrian field survey, Native American Consultation, and vertebrate paleontological resources assessment were conducted for the project in partial fulfillment of the California Environmental Quality Act (CEQA). The records search revealed that 14 previous cultural resources studies have taken place, and 17 cultural resources (14 historic, one prehistoric, and two unknown due to missing files) have been recorded within one-mile of the project site. Of the 17 previous studies, none has assessed the project site, and no cultural resources have been previously recorded within its boundaries.

During the field survey, BCR Consulting archaeologists identified one historic-period residence consisting of a house and associated features. The residence is not considered eligible for the California Register of Historical Resources (California Register), and as such is not considered a "historical resource" under CEQA. It does not warrant further consideration. BCR Consulting recommends that no additional cultural resources work or monitoring is necessary for any proposed project activities. However, if previously undocumented cultural resources are identified during earthmoving activities, a qualified archaeologist shall be contacted to assess the nature and significance of the find, diverting construction excavation if necessary.

Department of Park and Recreation (DPR) 523 forms have been used to document the historic-period residence and are included in Appendix A. Native American Consultation results are provided in Appendix B, the Paleontological Resources Assessment is included as Appendix C, and project photographs are included as Appendix D.

If human remains are encountered during the undertaking, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

INTRODUCTION

BCR Consulting LLC (BCR Consulting) is under contract to RGP Planning & Development Services (RGP) to complete a Cultural Resources Assessment of the proposed White Road Solar Photovoltaic Installation Project (project) in San Bernardino County, California. A cultural resources records search, additional research, intensive-level pedestrian field survey, Native American Consultation, and vertebrate paleontological resources assessment were conducted for the project in partial fulfillment of the California Environmental Quality Act (CEQA). The project involves the development of a solar photovoltaic system. It occupies 47 acres and is bounded by Nielson Road on the north, Muscatel Street on the South, White Road on the east, and Pueblo Trail on the west. It is located in the southeast quarter of Section 23, Township 4 North, Range 6 West, San Bernardino Baseline and Meridian. It is depicted on the United States Geological Survey (USGS) *Baldy Mesa, California* (1995) 7.5-minute topographic quadrangle (Figure 1).

NATURAL SETTING

Geology

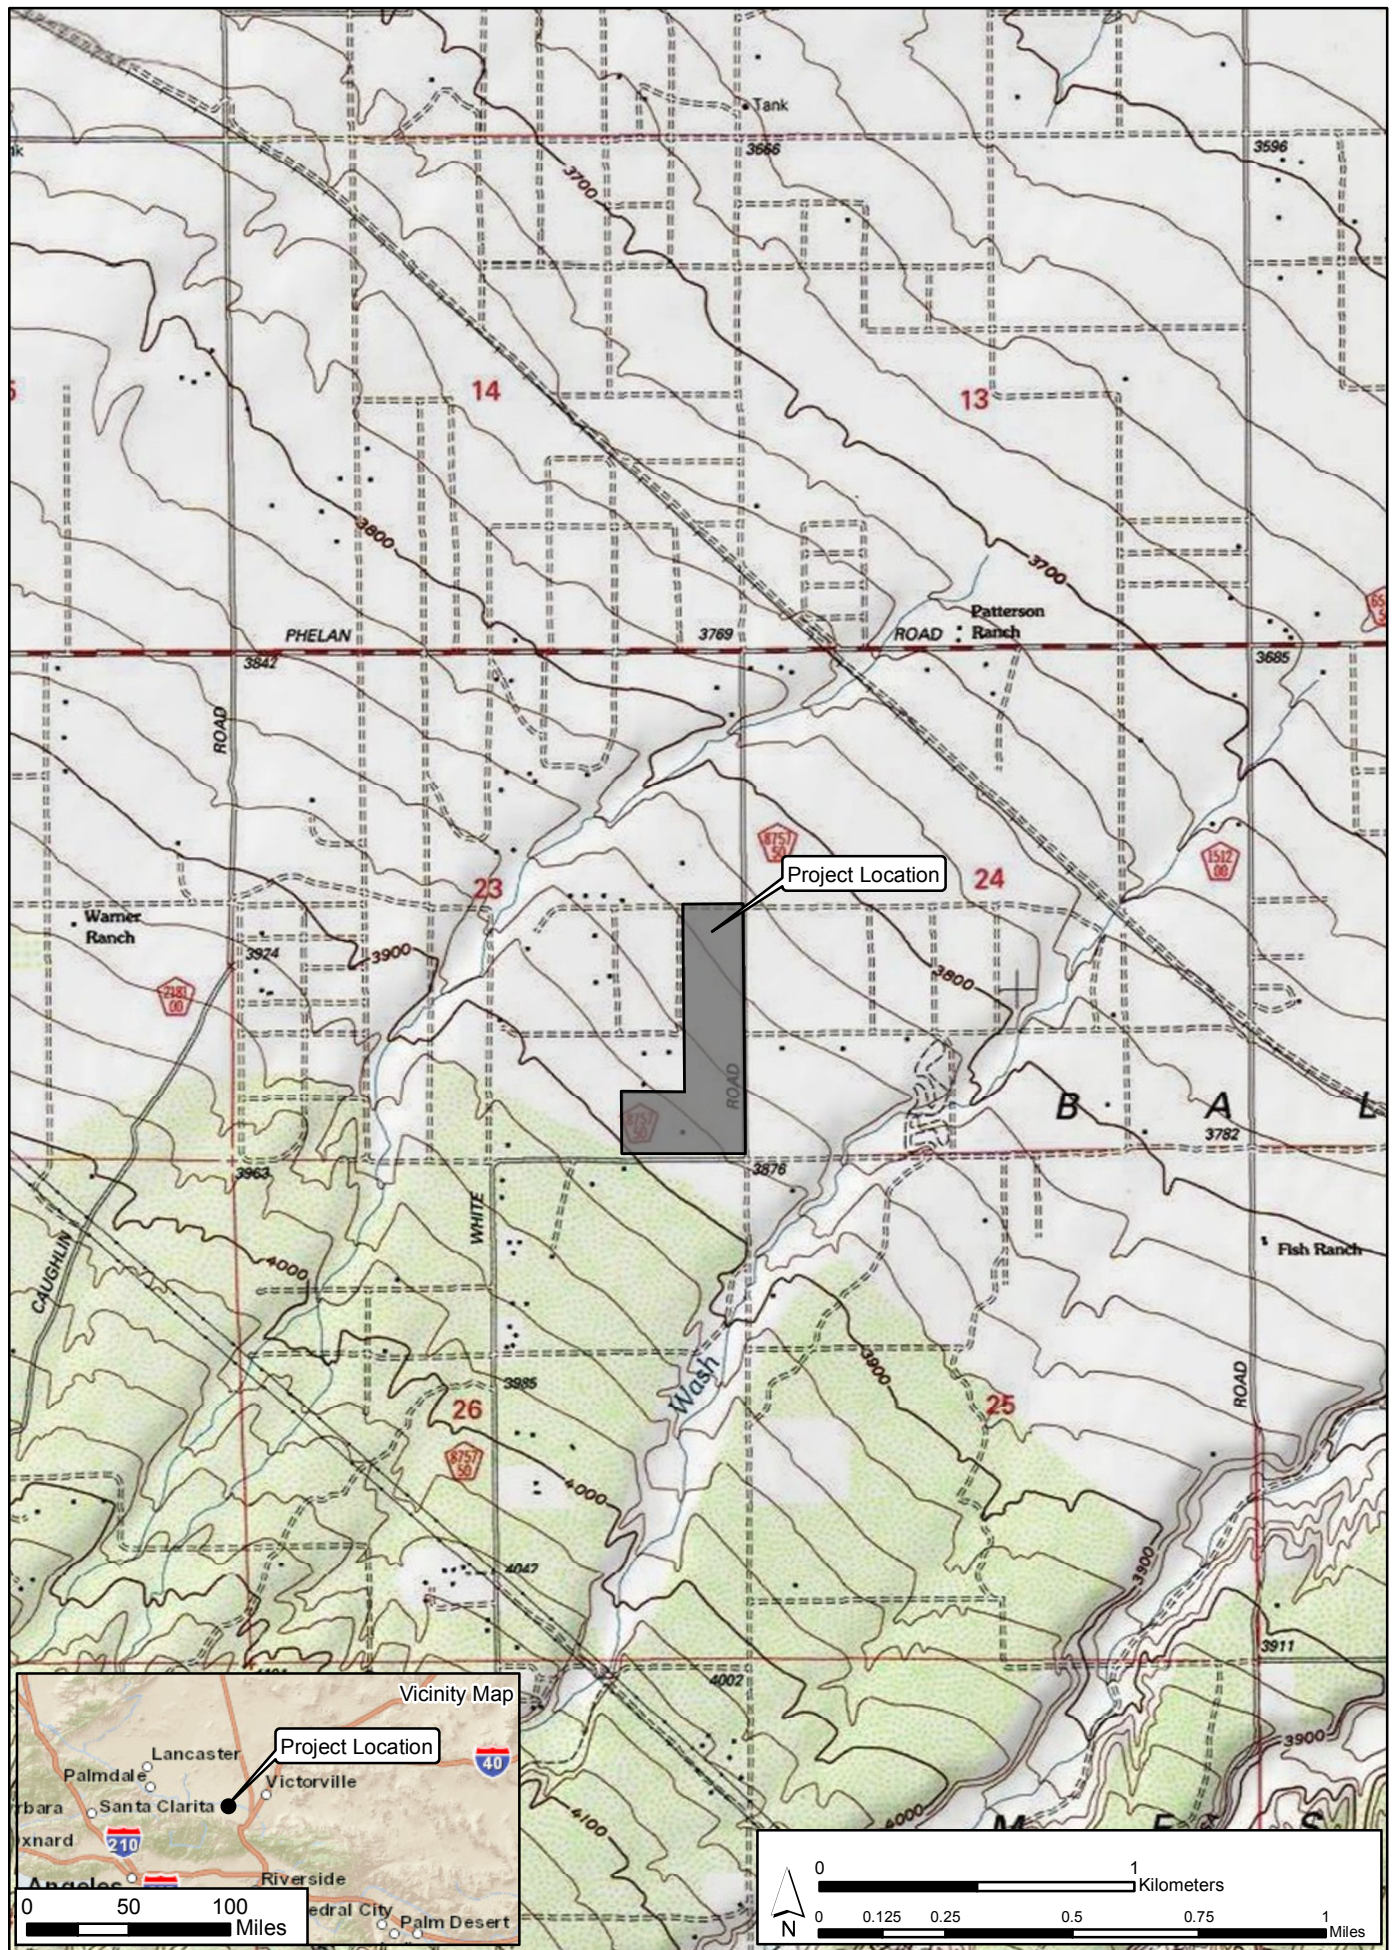

The project is located in the southwestern portion of the Mojave Desert. Sediments within the project boundaries include a geologic unit composed of young alluvial fan deposits formed during the late Pleistocene and Holocene Epochs of the Quaternary Period (Miller and Matti 2006, Lambert 1994:17). The unit is composed of “slightly consolidated, undissected to slightly dissected deposits of poorly sorted sand and silt containing scattered subangular pebbles” (Miller and Matti 2006). Field observations during the current study are basically consistent with these descriptions, although surface examinations revealed the presence of some granitic, quartz, and andesite gravel, pebble, and cobble deposits. None of the materials observed during the field survey exhibited evidence of the manufacture or acquisition of prehistoric stone tools or materials.

Hydrology

The project elevation ranges from approximately 3,825 to 3,910 feet above mean sea level (AMSL). Sheetwashing is apparent from southwest to northeast across the project site. To the southeast, the peaks of the San Bernardino Mountains rise above 10,000 feet and are often capped with snow until late spring or early summer. The area currently exhibits an arid climate, with dry, hot summers and cool winters. Rainfall ranges from five to 15 inches annually (Jaeger and Smith 1971:36-37). Precipitation usually occurs in the form of winter and spring rain or snow at high elevations, with occasional warm monsoonal showers in late summer.

Biology

The mild climate of the late Pleistocene allowed piñon-juniper woodland to thrive throughout most of the Mojave (Van Devender et al. 1987). The vegetation and climate during that epoch attracted significant numbers of Rancholabrean fauna, including dire wolf, saber-toothed cat, short-faced bear, horse, camel, antelope, mammoth, pelican, goose, duck, cormorant, and eagle (Reynolds 1988). The drier climate of the middle Holocene resulted in the local development of complementary flora and fauna, which remain largely intact to this day. Common native plants currently include creosote, cacti (various species), rabbit bush, interior golden bush, cheesebush, sage (various species), buckwheat (at high elevations and near drainages), Joshua tree, and seasonal grasses. Common native animals include

coyotes, cottontail and jackrabbits, rats, mice, desert tortoises, roadrunners, raptors, turkey vultures, and other bird species (see Williams et al. 2008).

CULTURAL SETTING

Prehistory

The prehistoric cultural setting of the Mojave Desert has been organized into many chronological frameworks (see Warren and Crabtree 1986; Bettinger and Taylor 1974; Lanning 1963; Hunt 1960; Wallace 1958, 1962, 1977; Wallace and Taylor 1978; Campbell and Campbell 1935), although there is no definitive sequence for the region. The difficulties in establishing cultural chronologies for the Mojave are a function of its enormous size and the small amount of archaeological excavations conducted there. Moreover, throughout prehistory many groups have occupied the Mojave and their territories often overlap spatially and chronologically resulting in mixed artifact deposits. Due to dry climate and capricious geological processes, these artifacts rarely become integrated in-situ. Lacking a milieu hospitable to the preservation of cultural midden, Mojave chronologies have relied upon temporally diagnostic artifacts, such as projectile points, or upon the presence/absence of other temporal indicators, such as groundstone. Such methods are instructive, but can be limited by prehistoric occupants' concurrent use of different artifact styles, or by artifact re-use or re-sharpening, as well as researchers' mistaken diagnosis, and other factors (see Flenniken 1985; Flenniken and Raymond 1986; Flenniken and Wilke 1989). Recognizing the shortcomings of comparative temporal indicators, this study synthesizes Warren and Crabtree (1986), who have drawn upon this method to produce a commonly cited and relatively comprehensive chronology.

Paleoindian (12,000 to 10,000 BP) and Lake Mojave (10,000 to 7,000 BP) Periods.

Climatic warming characterizes the transition from the Paleoindian Period to the Lake Mojave Period. This transition also marks the end of Pleistocene Epoch and ushers in the Holocene. The Paleoindian Period has been loosely defined by isolated fluted (such as Clovis) projectile points, dated by their association with similar artifacts discovered in-situ in the Great Plains (Sutton 1996:227-228). Some fluted bifaces have been associated with fossil remains of Rancholabrean mammals approximately dated to ca. 13,300-10,800 BP near China Lake in the northern Mojave Desert. The Lake Mojave Period has been associated with cultural adaptations to moist conditions, and resource allocation pointing to more lacustrine environments than previously (Bedwell 1973; Hester 1973). Artifacts that characterize this period include stemmed points, flake and core scrapers, choppers, hammerstones, and crescentics (Warren and Crabtree 1986:184). Projectile points associated with the period include the Silver Lake and Lake Mojave styles. Lake Mojave sites commonly occur on shorelines of Pleistocene lakes and streams, where geological surfaces of that epoch have been identified (Basgall and Hall 1994:69).

Pinto Period (7,000 to 4,000 BP). The Pinto Period has been largely characterized by desiccation of the Mojave. As formerly rich lacustrine environments began to disappear, the artifact record reveals more sporadic occupation of the Mojave, indicating occupants' recession to the more hospitable fringes (Warren 1984). Pinto Period sites are rare, and are characterized by surface manifestations that usually lack significant in-situ remains. Artifacts from this era include Pinto projectile points and a flake industry similar to the Lake Mojave tool complex (Warren 1984), though use of Pinto projectile points as an index artifact for the era has been disputed (see Schroth 1994). Milling stones have also occasionally been associated with sites of this period (Warren 1984).

Gypsum Period. (4,000 to 1,500 BP). A temporary return to moister conditions during the Gypsum Period is postulated to have encouraged technological diversification afforded by the relative abundance of resources (Warren 1984:419-420; Warren and Crabtree 1986:189). Lacustrine environments reappear and begin to be exploited during this era (Shutler 1961, 1968). Concurrently a more diverse artifact assemblage reflects intensified reliance on plant resources. The new artifacts include milling stones, mortars, pestles, and a proliferation of Humboldt Concave Base, Gypsum Cave, Elko Eared, and Elko Corner-notched dart points (Warren 1984; Warren and Crabtree 1986). Other artifacts include leaf-shaped projectile points, rectangular-based knives, drills, large scraper planes, choppers, hammer stones, shaft straighteners, incised stone pendants, and drilled slate tubes. The bow and arrow appears around 2,000 BP, evidenced by the presence of a smaller type of projectile point, the Rose Spring point (Rogers 1939; Shutler 1961; Yohe 1992).

Saratoga Springs Period (1,500 to 800 BP). During the Saratoga Springs Period regional cultural diversifications of Gypsum Period developments are evident within the Mojave. Basketmaker III (Anasazi) pottery appears during this period, and has been associated with turquoise mining in the eastern Mojave Desert (Warren and Crabtree 1986:191). Influences from Patayan/Yuman assemblages are apparent in the southern Mojave, and include buff and brown wares often associated with Cottonwood and Desert Side-notched projectile points (Warren 1984:423). Obsidian becomes more commonly used throughout the Mojave and characteristic artifacts of the period include milling stones, mortars, pestles, ceramics, and ornamental and ritual objects. More structured settlement patterns are evidenced by the presence of large villages, and three types of identifiable archaeological sites (major habitation, temporary camps, and processing stations) emerge (McGuire and Hall 1988). Diversity of resource exploitation continues to expand, indicating a much more generalized, somewhat less mobile subsistence strategy.

Shoshonean Period (800 BP to Contact). The Shoshonean period is the first to benefit from contact-era ethnography –as well as be subject to its inherent biases. Interviews of living informants allowed anthropologists to match artifact assemblages and particular traditions with linguistic groups, and plot them geographically (see Kroeber 1925; Gifford 1918; Strong 1929). During the Shoshonean Period continued diversification of site assemblages, and reduced Anasazi influence both coincide with the expansion of Numic (Uto-Aztecan language family) speakers across the Great Basin, Takic (Uto-Aztecan language family) speakers into southern California, and the Hopi across the Southwest (Sutton 1996). Hunting and gathering continued to diversify, and the diagnostic arrow points include desert side-notch and cottonwood triangular. Ceramics continue to proliferate, though are more common in the southern Mojave during this period (Warren and Crabtree 1986). Trade routes have become well established across the Mojave, particularly the Mojave Trail, which transported goods and news across the desert via the Mojave River, to the west of the current project. Trade in the western Mojave was more closely related to coastal groups than others.

Ethnography

The Uto-Aztecan “Serrano” people occupied the western Mojave Desert periphery. Kroeber (1925) applied the generic term “Serrano” to four groups, each with distinct territories: the Kitanemuk, Tataviam, Vanyume, and Serrano. Only one group, in the San Bernardino Mountains and West-Central Mojave Desert, ethnically claims the term Serrano. Bean and Smith (1978) indicate that the Vanyume, an obscure Takic population, was found along the

Mojave River at the time of Spanish contact. The Kitanemuk lived to the north and west, while the Tataviam lived to the west. The Serrano lived mainly to the south (Bean and Smith 1978). All may have used the western Mojave area seasonally. Historical records are unclear concerning precise territory and village locations. It is doubtful that any group, except the Vanyume, actually lived in the region for several seasons yearly.

History

Historic-era California is generally divided into three periods: the Spanish or Mission Period (1769 to 1821), the Mexican or Rancho Period (1821 to 1848), and the American Period (1848 to present).

Spanish Period. The first European to pass through the project area is thought to be a Spaniard called Father Francisco Garcés. Having become familiar with the area, Garcés acted as a guide to Juan Bautista de Anza, who had been commissioned to lead a group across the desert from a Spanish outpost in Arizona to set up quarters at the Mission San Gabriel in 1771 near what today is Pasadena (Beck and Haase 1974). This is the first recorded group crossing of the Mojave Desert and, according to Father Garcés' journal, they camped at the headwaters of the Mojave River, one night less than a day's march from the mountains. Today, this is estimated to have been approximately 11 miles southeast of Victorville (Marenczuk 1962). Garcés was followed by Alta California Governor Pedro Fages, who briefly explored the western Mojave region in 1772. Searching for San Diego Presidio deserters, Fages had traveled north through Riverside to San Bernardino, crossed over the mountains into the Mojave Desert, and then journeyed westward to the San Joaquin Valley (Beck and Haase 1974).

Mexican Period. In 1821, Mexico overthrew Spanish rule and the missions began to decline. By 1833, the Mexican government passed the Secularization Act, and the missions, reorganized as parish churches, lost their vast land holdings, and released their neophytes (Beattie and Beattie 1974).

American Period. The American Period, 1848–Present, began with the Treaty of Guadalupe Hidalgo. In 1850, California was accepted into the Union of the United States primarily due to the population increase created by the Gold Rush of 1849. The cattle industry reached its greatest prosperity during the first years of the American Period. Mexican Period land grants had created large pastoral estates in California, and demand for beef during the Gold Rush led to a cattle boom that lasted from 1849–1855. However, beginning about 1855, the demand for beef began to decline due to imports of sheep from New Mexico and cattle from the Mississippi and Missouri Valleys. When the beef market collapsed, many California ranchers lost their ranches through foreclosure. A series of disastrous floods in 1861–1862, followed by a significant drought diminished the economic impact of local ranching. This decline combined with ubiquitous agricultural and real estate developments of the late 19th century, set the stage for diversified economic pursuits that have continued to proliferate to this day (Beattie and Beattie 1974; Cleland 1941).

Local Sequence. Early development of the Phelan area primarily focused on ranching and homesteading. Local lack of water was particularly problematic until 1917, when the Sheep Creek Water Company was formed to pipe in water from Sheep Creek Canyon to the southwest. Homesteads established outside this newly formed water grid developed a pattern of cistern use. The cisterns required periodic filling by a water truck service, and

were built to catch rainwater and other potable runoff. Access to reliable water combined with an easing of Homestead Act requirements made it easier for World War I veterans to acquire patents for public lands (Swanson 1991:14-15). As a result, by 1923 homesteads had claimed most of the available land, and a post office was locally established. By the 1930s three large ranches were operating in the Phelan area: Patterson, Warner, and Johnson (ibid.; USGS 1942). Ranching has become less locally viable since the 1960s, although the Phelan area has resisted suburban developments typical in some neighboring communities. The local rural character has been preserved partially due to a requirement to limit residential parcels to 2.5 acres (Wilson 2008).

PERSONNEL

David Brunzell, M.A., RPA acted as the Project Manager and Principal Investigator for the current study. Mr. Brunzell also conducted the cultural resources records search at the San Bernardino Archaeological Information Center (SBAIC) located at the San Bernardino County Museum in Redlands, California. Mr. Brunzell also completed the field assessment, compiled the technical report, and provided oversight.

RESEARCH DESIGN

This work was completed pursuant to CEQA, the Public Resources Code (PRC) Chapter 2.6, Section 21083.2, and California Code of Regulations (CCR) Title 14, Chapter 3, Article 5, Section 15064.5. The pedestrian cultural resources survey is intended to locate and document previously recorded or new cultural resources, including archaeological sites, features, isolates, and historic buildings, that exceed 45 years in age within defined project boundaries. The project site was examined using 15 meter transect intervals, where accessible.

The study is intended to determine whether cultural resources are located within the project boundaries, whether any cultural resources are significant pursuant to the above-referenced regulations and standards, and to develop specific mitigation measures that will address potential impacts to existing or potential resources. Tasks pursued to achieve that end include:

- Sacred Lands File Search through the Native American Heritage Commission, and sending consultation letters to recommended tribes and individuals
- Vertebrate paleontology resources report through Dr. Samuel McLeod of the Natural History Museum of Los Angeles County
- Cultural resources records search to review any studies conducted and the resulting cultural resources recorded within a one-mile radius of the project boundaries
- Additional research through various local and regional resources
- Systematic pedestrian survey of the entire project site
- Evaluation of California Register of Historical Resources (California Register) eligibility for any cultural resources discovered
- Development of recommendations and mitigation measures for cultural resources documented within the project boundaries, following CEQA and County guidelines
- Completion of Department of Park and Recreation (DPR) 523 forms for any discovered cultural resources.

METHODS

Research

Records Search. Prior to fieldwork, a records search was conducted at the SBAIC. This archival research reviewed the status of all recorded historic and prehistoric cultural resources, and survey and excavation reports completed within one mile of the current project. Additional resources reviewed included the National Register of Historic Places (National Register), the California Register, and documents and inventories published by the California Office of Historic Preservation. These include the lists of California Historical Landmarks, California Points of Historical Interest, Listing of National Register Properties, and the Inventory of Historic Structures.

Additional Research. Additional research was conducted through the Phelan Memorial Library, the Map Collection housed at the University of California, Riverside Science Library, and through various internet resources. BCR Consulting has also initiated a Sacred Lands File Search with the Native American Heritage Commission (NAHC) followed by consultation with recommended tribes and individuals. The Sacred Lands File Search revealed no cultural resources within one-half mile of the project site boundaries. The NAHC provided a list of potentially concerned tribes and individuals to be contacted regarding the current project. BCR Consulting sent letters and emails, and made follow-up phone calls to those individuals to document any concerns. The results of these communications are summarized in Appendix B.

Field Survey

An intensive-level cultural resources field survey of the project site was conducted on April 25, 2013. The survey was conducted by walking parallel transects spaced approximately 15 meters apart across 100 percent of the project site, where accessible. Cultural Resources were recorded on DPR 523 forms. Ground visibility averaged approximately 60 percent within project boundaries. Digital photographs were taken at various points within the project site. These included overviews as well as detail photographs of all cultural resources. Cultural resources were recorded per the California OHP *Instructions for Recording Historical Resources* in the field using:

- Detailed note taking for entry on DPR Forms (see Appendix A)
- Hand-held Garmin Global Positioning systems for mapping purposes
- Digital photography of all cultural resources (see Appendix D).

RESULTS

Research

Records Search. Data from the SBAIC revealed that 14 previous cultural resources studies have taken place, and 17 cultural resources (14 historic, one prehistoric, and two unknown due to missing files) have been recorded within one-mile of the project site. Of the 17 previous studies, none have assessed the project site, and no cultural resources have been previously recorded within its boundaries. The records search is summarized as follows:

Table A. Cultural Resources and Reports Within One Mile of the Project Site

USGS 7.5 Minute Quadrangle	Cultural Resources Within One Mile of Project Site	Studies Within One Mile of Project Site
<i>Baldy Mesa, California</i> (1995)	CA-SBR-2619, 3372, 4268H, 4271H, 4411H, 4423H, 6827H, 6828H, 6830H, 6832H, 13373, 20674, P1332-1H, P1332-2H, P1332-3H, P1332-4H, P1332-5H	SB-1061095, 1061474, 1062405, 1064295, 1064296, 1064453, 1064798, 1065173, 1065698, 1065773, 1065817, 1066228, 1066601, 1066854

Additional Research. Additional research revealed that the project site contained a historic building by 1938. This property was established as part of a 160-acre homestead awarded to George Washington Hooser in 1917 (General Land Office 1917). As part of his homestead obligation, Mr. Hooser established a farm (no longer present) and constructed two buildings on the original property, including the house mentioned above and an unspecified building to the northwest of the current study area (ibid; State of California 1916; USDA 1938).

Field Survey

RGP1302-H-1. During the field survey David Brunzell carefully inspected the project site and identified the historic-period residence (temporarily designated as RGP1302-H-1) indicated during the Research. The residence consisted of a house with attached garage, overturned outhouse, and yard. The house within the study area is a simple, one-story vernacular structure constructed circa 1917-1938. The roof is aluminum and side-gabled. The house exhibits severe alterations, including an addition that spans the length of the original building along the east elevation, and a one-car garage attached to the original north elevation. It is wood frame with non-original fabricated siding and contains various double-hung and aluminum windows that clearly mark the placement of the alterations. The house is in fair condition, but alterations have compromised its integrity. A modern outhouse is lying on its side to the north of the house. Six rock piles have been stacked in the yard to the southeast of the house, and consist of native and non-native rocks and debris. One prehistoric quartzite core and several amethyst glass fragments were noted in these piles, but they lack provenience. Outside the residential area surrounding the house, the area is overgrown in natural vegetation and retains no evidence of homesteading activities.

No other cultural resources were noted. Surface visibility was approximately 60 percent within the project site. Artificial ground disturbances were limited to off-road vehicle activity. Natural disturbances included sheet washing and rilling.

SIGNIFICANCE EVALUATIONS

During the field survey, one historic-period resource was identified. CEQA (PRC Chapter 2.6, Section 21083.2 and CCR Title 145, Chapter 3, Article 5, Section 15064.5) calls for the evaluation and recordation of historic and archaeological resources. The criteria for determining the significance of impacts to cultural resources are based on Section 15064.5 of the *CEQA Guidelines* and Guidelines for the Nomination of Properties to the California Register. Properties eligible for listing in the California Register and subject to review under CEQA are those meeting the criteria for listing in the California Register, National Register, or designation under a local ordinance.

Significance Criteria

California Register of Historical Resources. The California Register criteria are based on National Register criteria. For a property to be eligible for inclusion on the California Register, one or more of the following criteria must be met:

1. It is associated with the events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the U.S.;
2. It is associated with the lives of persons important to local, California, or U.S. history;
3. It embodies the distinctive characteristics of a type, period, region, or method of construction, represents the work of a master, possesses high artistic values; and/or
4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

In addition to meeting one or more of the above criteria, the California Register requires that sufficient time has passed since a resource's period of significance to "obtain a scholarly perspective on the events or individuals associated with the resources." (CCR 4852 [d][2]). The California Register also requires that a resource possess integrity. This is defined as the ability for the resource to convey its significance through seven aspects: location, setting, design, materials, workmanship, feeling, and association.

Evaluation

RGP1302-H-1. Like many properties in the Phelan community, this historic homestead was developed during the early part of the 20th century. The house was constructed between 1917 and 1938 and is associated with homestead development common throughout the region during the post World War I era. Other than the historic-period house, no evidence of homesteading activity remains within the project site. Also, the house has been subject to severe alterations. As a result the homestead property and house have lost integrity of setting, design, materials, workmanship, feeling, and association.

Criterion 1: RGP1302-H-1 represents development homestead common throughout the region during the period(s) of significance (early 20th century/post World War I era) and as such is not associated with any events that have made a significant contribution to the broad patterns of local or regional history. Criterion 2: Extensive research has failed to specifically associate the property with any individuals who have been notable in local, state, or national history. Criterion 3: The house is a simple example of a vernacular house and does not embody the distinctive characteristics of a type, period, region, or method of construction, or represent the work of an important creative individual or possess high artistic values. Criterion 4: Extensive research has exhausted this resource's data potential, and as such the resource has not and is not likely to yield information important in prehistory or history. The historic-age building and associated features are therefore not considered eligible under any of the four criteria for listing on the California Register and have shown to lack integrity of setting, design, materials, workmanship, feeling, and association. As a result the historic-age building and associated features are not considered a historical resource under the California Environmental Quality Act (CEQA).

RECOMMENDATIONS

Based on these results, BCR Consulting recommends that no additional cultural resources work or monitoring is necessary during proposed project activities associated with the White Road Solar Photovoltaic Installation Project. Therefore, no significant impacts related to archaeological or historical resources is anticipated and no further investigations are recommended for the proposed project unless:

- the proposed project is changed to include areas not subject to this study;
- the proposed project is changed to include the construction of additional facilities;
- cultural materials are encountered during project activities.

Although the current study has not indicated sensitivity for cultural resources within the project boundaries, ground disturbing activities always have the potential to reveal buried deposits not observed on the surface during previous surveys. Prior to the initiation of ground-disturbing activities, field personnel should be alerted to the possibility of buried prehistoric or historic cultural deposits. In the event that field personnel encounter buried cultural materials, work in the immediate vicinity of the find should cease and a qualified archaeologist should be retained to assess the significance of the find. The qualified archaeologist shall have the authority to stop or divert construction excavation as necessary. If the qualified archaeologist finds that any cultural resources present meet eligibility requirements for listing on the California Register or the National Register, plans for the treatment, evaluation, and mitigation of impacts to the find will need to be developed. Prehistoric or historic cultural materials that may be encountered during ground-disturbing activities include:

- historic artifacts such as glass bottles and fragments, cans, nails, ceramic and pottery fragments, and other metal objects;
- historic structural or building foundations, walkways, cisterns, pipes, privies, and other structural elements;
- prehistoric flaked-stone artifacts and debitage (waste material), consisting of obsidian, basalt, and or cryptocrystalline silicates;
- groundstone artifacts, including mortars, pestles, and grinding slabs;
- dark, greasy soil that may be associated with charcoal, ash, bone, shell, flaked stone, groundstone, and fire affected rocks;

If human remains are encountered during the undertaking, State Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County Coroner has made a determination of origin and disposition pursuant to Public Resources Code Section 5097.98. The County Coroner must be notified of the find immediately. If the remains are determined to be prehistoric, the Coroner will notify the Native American Heritage Commission (NAHC), which will determine and notify a Most Likely Descendant (MLD). With the permission of the landowner or his/her authorized representative, the MLD may inspect the site of the discovery. The MLD shall complete the inspection within 48 hours of notification by the NAHC.

e. Other Locational Data: The property is accessed from Muscatel Street immediately west of White Road, approximately one mile south of Phelan Road in the Community of Phelan, San Bernardino County.

***P3a. Description:** (Describe resource and its major elements: design, materials, condition, alterations, size, setting, boundaries)

This resource consists of a residence containing a historic-period house with attached garage, outhouse, and yard. Research has indicated that this property was established as part of a 160-acre homestead awarded to George Washington Hooser in 1917 (General Land Office 1917). Mr. Hooser established a farm (no longer present) and constructed two buildings on the original property, including the house and an unspecified building to the northwest of the current study area (ibid; USDA 1938). The house within the study area is a simple, one-story vernacular structure constructed circa 1917-1938. The roof is aluminum and side-gabled. The house exhibits severe alterations, including an addition that spans the length of the original building along the east elevation, and a one-car garage attached to the original north elevation. It is wood frame with non-original fabricated siding and contains various double-hung and aluminum windows that clearly mark the placement of the alterations. The house is in fair condition, but alterations have compromised its integrity. An outhouse is lying on its side to the north of the house. Six rock piles have been stacked in the yard to the southeast of the house, and consist of native and non-native rocks and debris. One prehistoric quartzite core and several amethyst glass fragments were noted in these piles, but they lack provenience. Outside the residential area surrounding the house, the area is overgrown in natural vegetation and retains no evidence of homesteading.

NATIVE AMERICAN CONSULTATION

Subject: Sacred Lands File and List of Tribes/Individuals for the White Road Project, San Bernardino County, California

From: joseph brunzell (joebrunzell@gmail.com)

To: ds_nahc@pacbell.net;

Cc: david.brunzell@yahoo.com;

Date: Thursday, April 25, 2013 10:43 PM

Hi Dave,

I'd like to request a Sacred Lands File search and list of potentially interested tribes for the proposed White Road Project located in San Bernardino County, California . The proposed project is located in Section 23 of Township 4 North, Range 6 West, San Bernardino Baseline and Meridian. It is depicted on the USGS *Baldy Mesa* (1995), California 7.5 Minute Topographic Quadrangle (see attached map).*

Please send the list to my email or the below fax number, and please get in touch with any questions.

PLEASE NOTE: BCR CONSULTING HAS A NEW FAX NUMBER (SEE BELOW)!!

Re: Request for Sacred Lands File Search and Native American Contacts list for the
"White Road Project;" located in Baldy Mesa area; San Bernardino County,
California.

Dear Mr. Brunzell:

A record search of the NAHC Sacred Lands File failed to indicate the presence of Native American traditional cultural place(s) in the project site location submitted, based on the USGS coordinates, the Area of Potential Effect (APE). Also, NAHC SLF Inventory is not exhaustive; therefore, the absence of archaeological or Native American sacred places does not preclude their existence. Other data sources for Native American sacred places/sites should also be contacted. A Native American tribe of individual may be the only sources of presence of traditional cultural places or sites.

In the 1985 Appellate Court decision (170 Cal App 3rd 604), the Court held that the NAHC has jurisdiction and special expertise, as a state agency, over affected Native American resources impacted by proposed projects, including archaeological places of religious significance to Native Americans, and to Native American burial sites.

Attached is a list of Native American tribes, individuals/organization who may have knowledge of cultural resources in or near the project area. As part of the consultation process, the NAHC recommends that local governments and project developers contact the tribal governments and individuals to determine if any cultural places might be impacted by the proposed action. If a response is not received in two weeks of notification the NAHC requests that a follow telephone call be made to ensure that the project information has been received.

If you have any questions or need additional information, please contact me at (916) 653-6251.

Sincerely,

Dave Singleton
Program Analyst

Subject: Tribal Consultation for the White Road Project, San Bernardino County, California

Dear Joseph:

This is an invitation to consult on a proposed development project at locations with which you have tribal cultural affiliation. The purpose of the consultation is to ensure the protection of Native American cultural resources on which the proposed undertaking may have an impact. In the tribal consultation process, early consultation is encouraged in order to provide for full and reasonable public input from Native American Groups and Individuals, as consulting parties, on potential effect of the development project and to avoid costly delays. Further, we understand that much of the content of the consultation will be confidential and will include, but not be limited to, the relationship of proposed project details to Native American Cultural Historic Properties, such as burial sites, known or unknown, architectural features and artifacts, ceremonial sites, sacred shrines, cultural landscapes including traditional beliefs and practices. The proposed White Road Project site is located within Section 23 of Township 4 North, Range 6 West, San Bernardino Baseline and Meridian, and is depicted on the *Baldy Mesa* (1995), *California* USGS 7.5 Minute Topographic Quadrangle (see attached).

If you know of any cultural resources in the vicinity that may be of religious and/or cultural significance to your community or if you would like more information, please contact me at 909-525-7078 or david.brunzell@yahoo.com. Correspondence can also be sent to BCR Consulting, Attn: David Brunzell, 1420 Guadalajara Street, Claremont, California 91711. I request a response by May 15, 2013. If you require more time, please let me know. Thank you for your involvement in this process.

Sincerely,

BCR Consulting

In the tribal consultation process, early consultation is encouraged in order to provide for full and reasonable public input from Native American Groups and Individuals, as consulting parties, on potential effect of the development project and to avoid costly delays. Further, we understand that much of the content of the consultation will be confidential and will include, but not be limited to, the relationship of proposed project details to Native American Cultural Historic Properties, such as burial sites, known or unknown, architectural features and artifacts, ceremonial sites, sacred shrines, cultural landscapes including traditional beliefs and practices. The proposed White Road Project site is located within Section 23 of Township 4 North, Range 6 West, San Bernardino Baseline and Meridian, and is depicted on the *Baldy Mesa* (1995), *California* USGS 7.5 Minute Topographic Quadrangle (see attached).

If you know of any cultural resources in the vicinity that may be of religious and/or cultural significance to your community or if you would like more information, please contact me at 909-525-7078 or david.brunzell@yahoo.com. Correspondence can also be sent to BCR Consulting, Attn: David Brunzell, 1420 Guadalajara Street, Claremont, California 91711. I request a response by May 15, 2013. If you require more time, please let me know. Thank you for your involvement in this process.

Sincerely,

BCR Consulting

Subject: RE Tribal Consultation for Pinyon Hills, Duncan Road and White Road projects in San Bernardino County

From: Daniel McCarthy (DMcCarthy@sanmanuel-nsn.gov)

To: david.brunzell@yahoo.com;

Cc: Abrierty@SanManuel-NSN.Gov;

Date: Wednesday, May 15, 2013 2:50 PM

David, thank you for the opportunity to provide input on these projects. The results of a records search was not provided so it is difficult to determine what might be known about each of these project areas. We recommend that surveys be completed and that the resulting archaeological survey reports be provided to the Tribe for review. If cultural resources are identified, the Tribe would like that opportunity to provide comment. Thank you.

Regards,
//daniel

Attn: Joseph Brunzell, Staff Archaeologist

re: Paleontological resources for the proposed White Road Project, in Baldy Mesa, San Bernardino County, project area

Dear Joseph:

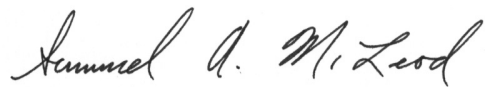

I have conducted a thorough check of our paleontology collection records for the locality and specimen data for the proposed White Road Project, in Baldy Mesa, San Bernardino County, project area as outlined on the portion of the Baldy Mesa topographic quadrangle map that you sent to me via e-mail on 1 May 2013. We do not have any vertebrate fossil localities that lie within the project boundaries, but we do have localities nearby from the same sedimentary units that may occur as subsurface deposits in the proposed project area.

Surficial sediments in most of the proposed project area consist of older Quaternary Alluvium, derived as coarse fan deposits from the San Gabriel Mountains to the south. In the various drainages, however, there are surficial deposits of younger Quaternary Alluvium, derived as fluvial deposits. We have no fossil vertebrate localities anywhere nearby from these Quaternary Alluvium deposits. Somewhat finer-grained older Quaternary deposits, such as those exposed east of the proposed project area east of Interstate 15, may occur at unknown depth below the exposed older Quaternary Alluvium in the proposed project area. Our closest fossil vertebrate locality in these older Quaternary deposits is LACM 1224, east-northeast of the proposed project area west of Spring Valley Lake, that produced a specimen of fossil camel, *Camelops*. Additionally, east-northeast of the proposed project area, on the western side of the Mojave River below the bluffs, an otherwise unrecorded specimen of mammoth was collected in 1961 from older Quaternary Alluvium deposits.

Surface grading or shallow excavations in the uppermost few feet of the coarse older Quaternary Alluvium exposed in the proposed project area are unlikely to uncover significant vertebrate fossils. Deeper excavations that extend into finer-grained older Quaternary deposits, however, may well encounter significant fossil vertebrate remains. Any substantial excavations in the proposed project area, therefore, should be monitored closely to quickly and professionally recover any fossil remains discovered while not impeding development. Any fossils recovered during mitigation should be deposited in an accredited and permanent scientific institution for the benefit of current and future generations.

This records search covers only the vertebrate paleontology records of the Natural History Museum of Los Angeles County. It is not intended to be a thorough paleontological survey of the proposed project area covering other institutional records, a literature survey, or any potential on-site survey.

Sincerely,

A handwritten signature in cursive script that reads "Samuel A. McLeod".

Samuel A. McLeod, Ph.D.
Vertebrate Paleontology
