I. INTRODUCTION

The purpose of this report is to provide an assessment of the traffic impacts resulting from the proposed VVR, LLC project, and to identify the traffic mitigation measures necessary to maintain the established Level of Service standard for the elements of the impacted roadway system. The traffic issues related to the proposed land uses and development have been evaluated in the context of the California Environmental Quality Act.

The County of San Bernardino is the lead agency responsible for preparation of the traffic impact analysis, in accordance with the California Environmental Quality Act authorizing legislation. This report analyzes traffic impacts for the anticipated initial opening date with partial occupancy in Year 2017, final opening date with full occupancy of the development in Year 2024, at which time it will be generating trips at its full potential, and for the Horizon Year (2035).

Although this is a technical report, every effort has been made to write the report clearly and concisely. To assist the reader with those terms unique to transportation engineering, a glossary of terms is provided in Appendix A.

A. Project Description

The proposed site is at the southwest corner of Phelan Road and Valle Vista Road in the County of San Bernardino. A vicinity map showing the project location is provided on Figure 1.

The project site is proposed to be developed with a commercial shopping center with 9 buildings totaling 77,817 square feet for multi-tenant restaurant, service station and retail on a vacant 10 acre parcel currently zoned as general commercial. Figure 2 illustrates the project site plan.

B. Study Area

Regional access to the project site is provided by the SR-138 and the I-15 Freeway. Local access is provided by various roadways in the vicinity of the site. The north-south roadways which will be most affected by the project include Beekley Road, Clovis Road, Sheep Creek Road, Valle Vista Road, and Johnson Road. The east-west roadways which will be most affected by the project include Phelan Road, and Nielson Road.

A series of scoping discussions were conducted with the following agency to define the desired analysis locations (see Appendix B):

- County of San Bernardino

In addition, the San Bernardino Transportation Analysis Model (SBTAM) has been obtained through discussions with the Southern California Association of Governments (SCAG) staff for purposes of this analysis for associated travel patterns.

No analysis is required further than 5 miles from the project site. The roadway elements that must be analyzed are dependent on both the analysis year (Opening Year or Horizon Year) and project generated traffic volumes. The identification of the study area, and the intersections and highway segments requiring analysis, was based on an estimate of the two-way traffic volumes on the roadway segments near the project site. All arterial segments have been included in the analysis when the anticipated project volume equals or exceeds 50 two-way trips in the peak hours. The requirement is 100 two-way peak hour trips for freeways.

The project does not contribute trips greater than the freeway threshold volume of 100 two-way peak hour trips. The project does contribute trips greater than the arterial link threshold volume of 50 two-way trips in the morning and evening peak hours in the County of San Bernardino.

C. Phasing and Timing

The project is proposed to be constructed in seven phases (see Figure 3). Each phase has between 3,960 to 24,770 square feet of retail space. The construction schedule for each of the phases has not been determined at this time. For the purposes of this analysis the phases are assumed to be constructed individually (one per year). The opening year of Phase 1 is 2017 and the opening year of Phase 7 is 2024. Existing Plus Project will exemplify the existing traffic conditions with the entire site built out.

D. Analysis Methodology

The analysis of the traffic impacts from the proposed development and the assessment of the required mitigation measures were based on an evaluation of the existing and forecast traffic conditions in the vicinity of the site with and without the project. The following analysis years are considered in this report:

- Existing Conditions (2014)
- Existing Plus Project Conditions¹
- Opening Year Conditions (2017) Phase 1
- Opening Year Conditions (2018) Phase 2
- Opening Year Conditions (2019) Phase 3
- Opening Year Conditions (2020) Phase 4
- Opening Year Conditions (2021) Phase 5
- Opening Year Conditions (2022) Phase 6
- Opening Year Conditions (2023) Phase 7
- Opening Year Conditions (2024) Phase 8
- Horizon Year Conditions (2035)

Existing intersection traffic conditions were established through morning and evening peak hour traffic counts obtained by Kunzman Associates, Inc. in December 2014 (see Appendix

¹ The existing plus project conditions has been analyzed to comply with the Sunnyvale West Neighborhood Association v. City of Sunnyvale CEQA court case. This scenario assumes the full development of the proposed project and full absorption of the proposed project trips on the circulation system at the present time.

C). In addition, truck classification counts were conducted at the study area intersections. The existing percent of trucks were used in the conversion of trucks to Passenger Car Equivalent's.

Project traffic volumes for all future projections were estimated using the manual approach. Trip generation has been estimated based on the Institute of Transportation Engineers, Trip Generation Manual, 9th Edition, 2012.

To determine the trip distributions for the proposed project, peak hour traffic counts of the existing directional distribution of traffic for existing areas in the vicinity of the site and other additional information were reviewed, including a San Bernardino Transportation Analysis Model select zone distribution for the project site.

The average daily traffic volume forecasts have been determined using the growth increment approach on the San Bernardino Transportation Analysis Model Year 2008 and Year 2035 average daily traffic volume forecasts (see Appendix D). Traffic model plots are included in Appendix E. This difference defines the growth in traffic over the 27 year period. The incremental growth in average daily traffic volume has been factored to reflect the forecast growth between Year 2014 and Year 2035. For this purpose, linear growth between the Year 2008 base condition and the forecast Year 2035 condition was assumed. Since the increment between Year 2014 and Year 2035 is 21 years of the 27 year time frame, a factor of 0.78 (i.e., 21/27) was used.

The Horizon Year (2035) without project daily and peak hour directional roadway segment volume forecasts have been determined using the growth increment approach on the San Bernardino Transportation Analysis Model Year 2008 and Year 2035 peak hour volumes. The growth increment calculation worksheets are shown in Appendix D. Current peak hour intersection approach/departure data is a necessary input to this approach. The existing traffic count data serves as both the starting point for the refinement process, and also provides important insight into current travel patterns and the relationship between peak hour and daily traffic conditions. The initial turning movement proportions are estimated based upon the relationship of each approach leg's forecast traffic volume to the other legs forecast volumes at the intersection. The initial estimate of turning movement proportions is then entered into a spreadsheet program consistent with the National Cooperative Highway Research Program Report 255. A linear programming algorithm is used to calculate individual turning movements that match the known directional roadway segment volumes computed in the previous step. This program computes a likely set of intersection turning movements from intersection approach counts and the initial turning proportions from each approach leg.

Potential other developments within the study area are included in the analysis if they are not currently built, they are approved, their approval has not expired, and they would contribute trips to the study area intersections. These developments are to provide a comprehensive analysis for growth augmentation of the San Bernardino Transportation Analysis Model data.

The Opening Year traffic volumes for each phase have been interpolated from the Horizon Year (2035) traffic volumes based upon a portion of the future growth increment.

Project traffic volumes were then added to the San Bernardino Transportation Analysis Model traffic volumes. Quality control checks and forecast adjustments were performed as necessary to ensure that all future traffic volume forecasts reflect a minimum of 10% growth over existing traffic volumes. The result of this traffic forecasting procedure is a series of traffic volumes suitable for traffic operations analysis.

The technique used to assess the capacity needs of an intersection is known as the Intersection Delay Method (see Appendix F) based on the Highway Capacity Manual – Transportation Research Board Special Report 209. To calculate delay, the volume of traffic using the intersection is compared with the capacity of the intersection. The signalized intersections are considered deficient (Level of Service F) if the overall intersection critical volume to capacity ratio equals or exceeds 1.0, even if the level of service defined by the delay value is below the defined Level of Service standard. The volume to capacity ratio is defined as the critical volumes divided by the intersection capacity. A volume to capacity ratio greater than 1.0 implies an infinite queue.

The Level of Service analysis for signalized intersections has been performed using optimized signal timing. This analysis has included an assumed lost time of two seconds per phase. Signal timing optimization has considered pedestrian safety and signal coordination requirements. Appropriate time for pedestrian crossings has also been considered in the signalized intersection analysis. The following formula has been used to calculate the pedestrian minimum times for all Highway Capacity Manual runs:

$$[(\text{Curb to curb distance}) / (3.5 \text{ feet/second})] + 7 \text{ seconds.}$$

For Existing/Existing Plus Project/Opening Year traffic conditions, saturation flow rates of 1,800 vehicles per hour of green for through and right turn lanes and 1,700 vehicles per lane for single left turn lanes, 1,600 vehicles per lane for dual left turn lanes and 1,500 vehicles per lane for triple left turn lanes have been assumed for the capacity analysis.

For Horizon Year (2035) traffic conditions, saturation flow rates of 1,900 vehicles per hour of green for through and right turn lanes and 1,800 vehicles per lane for single left turn lanes, 1,700 vehicles per lane for dual left turn lanes and 1,800 vehicles per lane for double right turn lanes have been assumed for the capacity analysis.

The peak hour traffic volumes have been adjusted to peak 15 minute volumes for analysis purposes using the existing observed peak 15 minute to peak hour factors for all scenarios analyzed. The Horizon Year (2035) peak hour factor has been adjusted upwards to 0.95. This is to account for the effects of congestion on peak spreading. Peak spreading refers to the tendency of traffic to spread more evenly across time as congestion increases.

The traffic mitigation needs anticipated at the time of the project opening with full occupancy and for the Horizon Year (2035) were combined into a summary of mitigation requirements and costs. The mitigation cost responsibility for the proposed development was estimated based on the percent of the increase in traffic from the existing condition to the Horizon Year (2035) that was attributed to the project-generated traffic.

E. Definition of Deficiency and Significant Impact

The following definitions of deficiencies and significant impacts have been developed in accordance with the County of San Bernardino requirements.

1. Definition of Deficiency

The definition of an intersection deficiency has been obtained from the County of San Bernardino General Plan. The General Plan states that peak hour intersection operations of Level of Service C or better are generally acceptable in the Desert Region of the County. Therefore, any intersection operating at Level of Service D or worse will be considered deficient.

For freeway facilities, the Congestion Management Program controls the definition of deficiency for purposes of this study. The Congestion Management Program definition of deficiency is based on maintaining a Level of Service standard of Level of Service E or better, except where an existing Level of Service F condition is identified in the Congestion Management Program document (San Bernardino County Congestion Management Program Table 2-1). A Congestion Management Program deficiency is, therefore, defined as any freeway segment operating or projected to operate at Level of Service F, unless the segment is identified explicitly in the Congestion Management Program document.

The identification of a Congestion Management Program deficiency requires further analysis in satisfaction of Congestion Management Program requirements, including:

- Evaluation of the mitigation measures required to restore traffic operations to an acceptable level with respect to Congestion Management Program Level of Service standards.
- Calculation of the project share of new traffic on the impacted Congestion Management Program facility during peak hours of traffic.
- Estimation of the cost required to implement the improvements required to restore traffic operations to an acceptable Level of Service as described above.

This study incorporates each of these aspects for all locations where a Congestion Management Program deficiency is identified.

2. Definition of Significant Impact

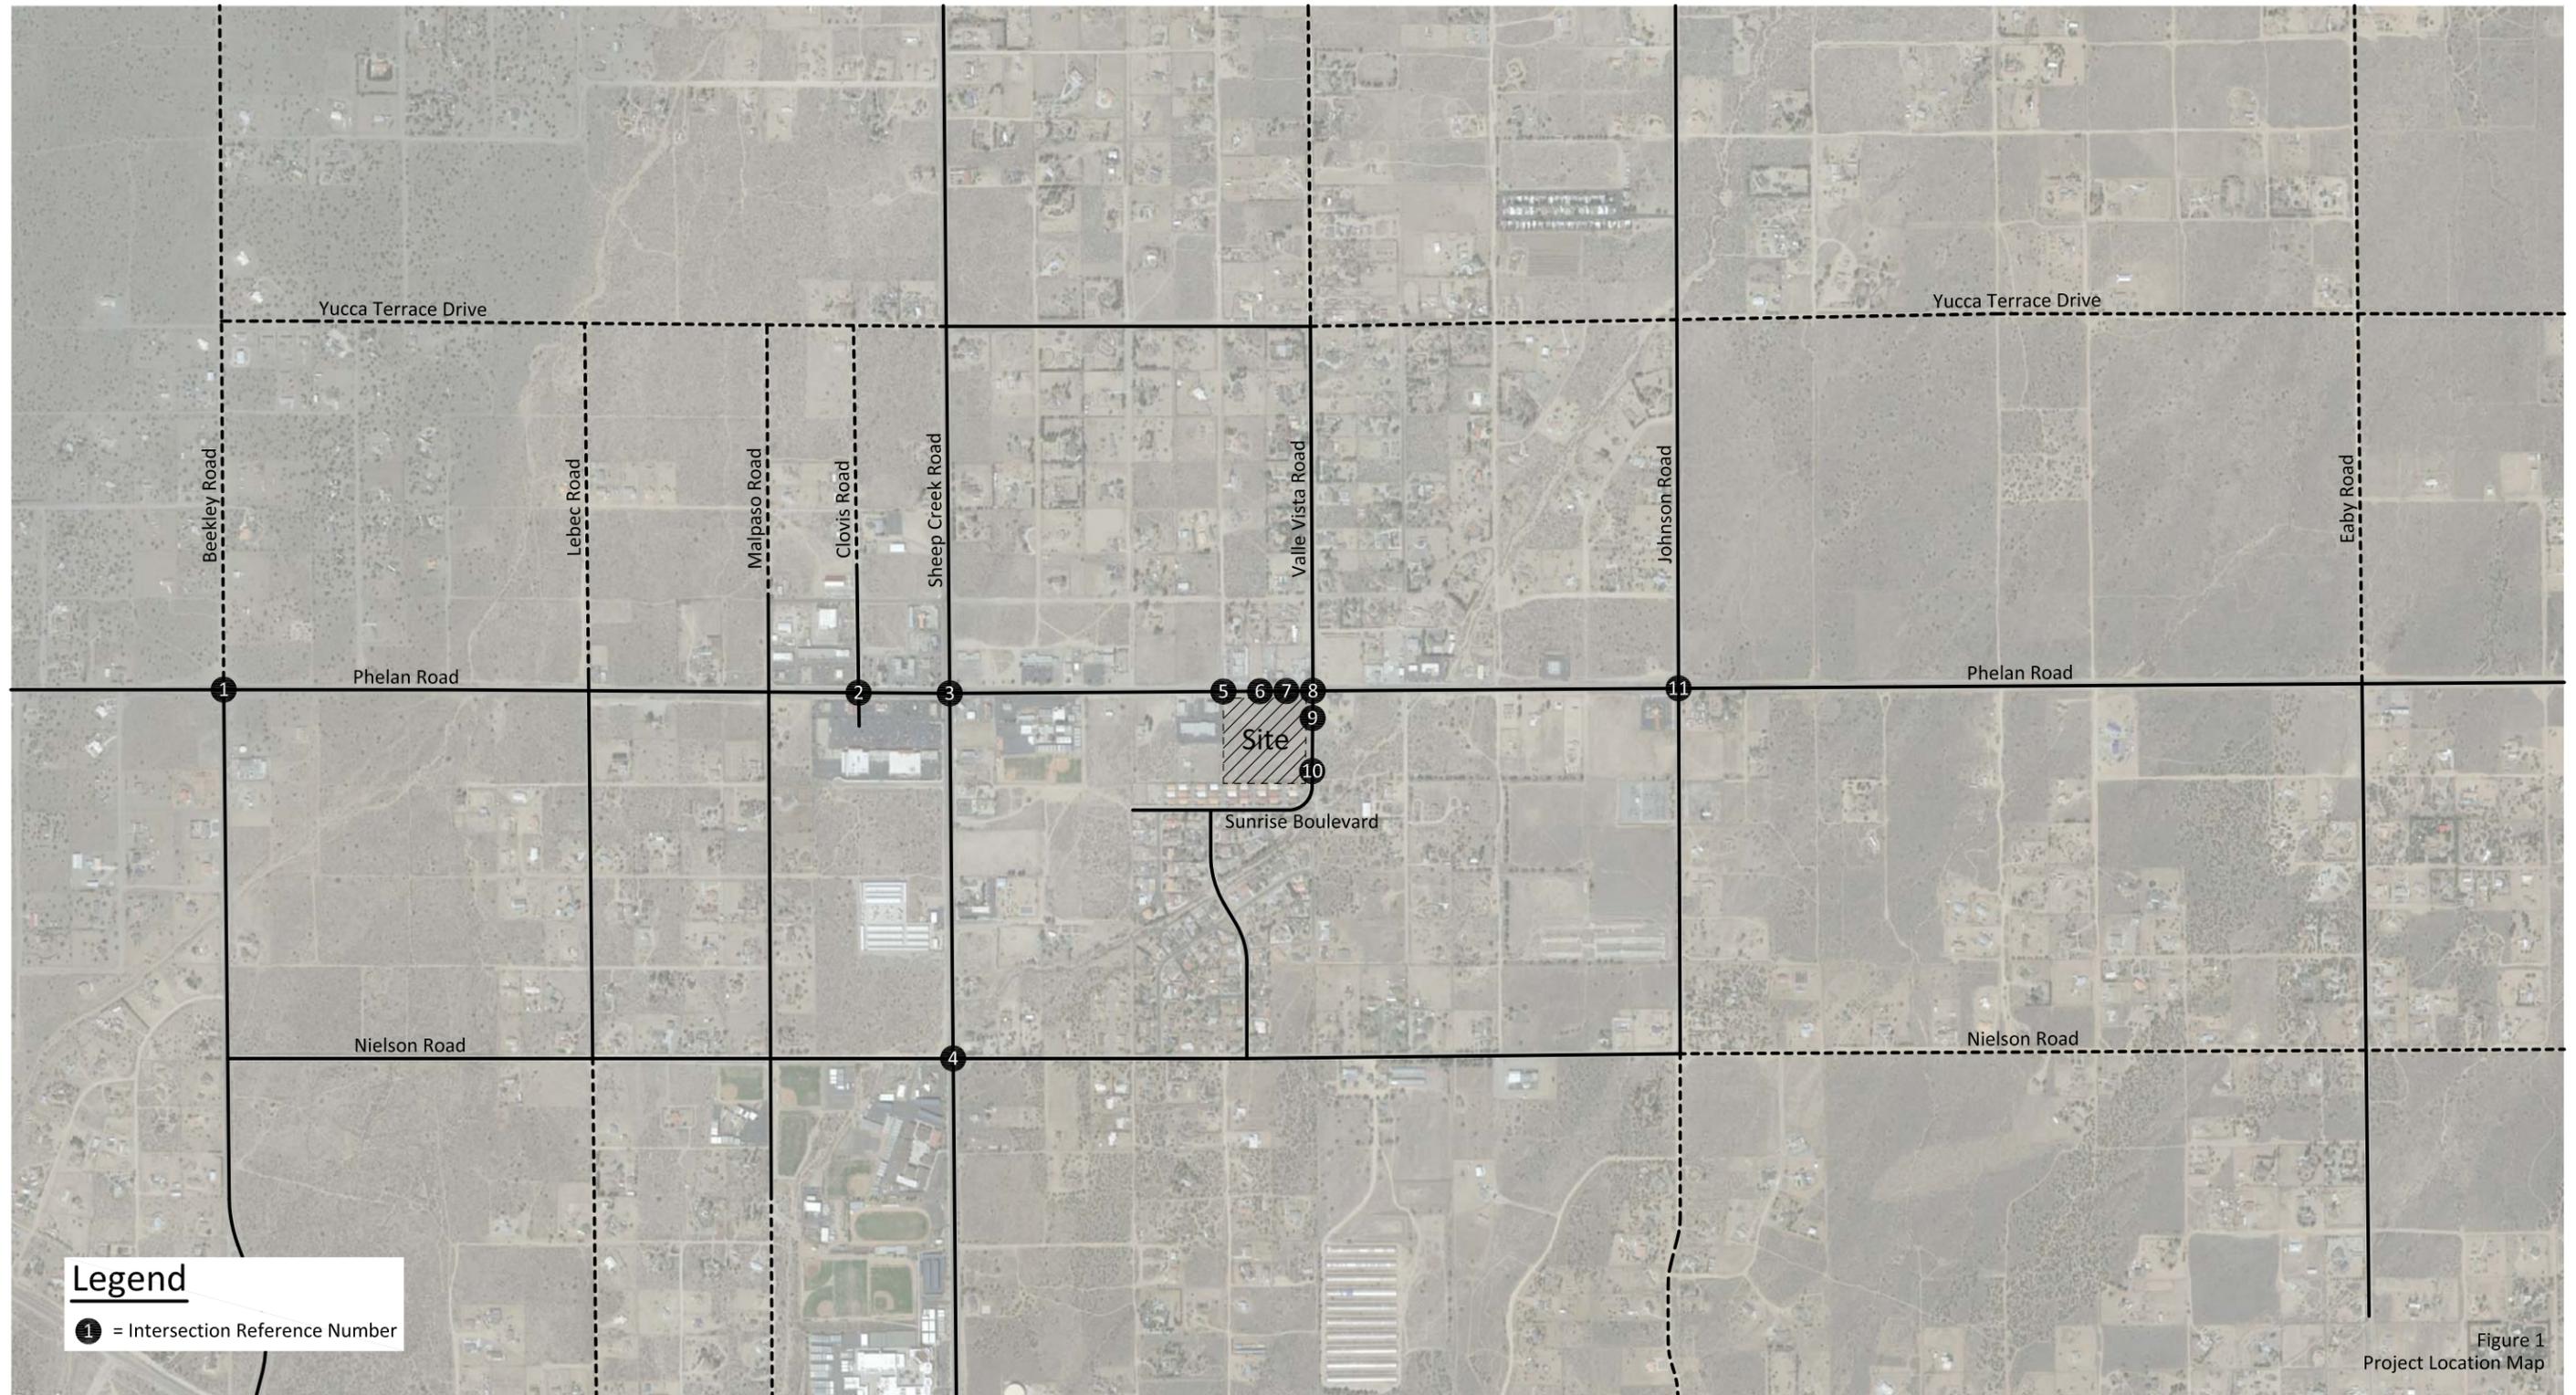

The identification of significant impacts is a requirement of California Environmental Quality Act. The County of San Bernardino General Plan and Circulation Element have been adopted in accordance with California Environmental Quality Act requirements, and any roadway improvements within the County of San Bernardino that are consistent with these documents are not considered a significant impact, so long as the project contributes its "fair share" funding or pro-rata contributions to the local transportation fee program for improvements.

This area of Phelan is currently not included in the Nexus improvements listing and improvements in this area are not eligible for Nexus transportation fee credits.

For intersections which have Level of Service D or better prior to the project, a traffic impact is considered significant if the project traffic contribution changes the Level of Service at any off-site location from D or better to E or worse. Level of service D may be maintained during interim improvements for Intersections, which currently have level of service D; however, level of service C or better will be provided with final improvements or pro-rata contributions for Year 2035 local transportation plan improvements and future signals.

For intersections which have Level of Service E or worse prior to the project, a traffic impact is considered significant if the project traffic contribution adds 10 or more trips in any approach or the intersection meets the peak hour traffic signal warrants after the addition of project traffic contribution.

II. EXISTING CONDITIONS

A. Existing Roadway System

Figure 4 identifies the existing conditions for study area roadways. The number of through lanes for existing roadways and the existing intersection controls are identified.

Regional access to the project site is provided by SR-138 and the I-15 Freeway. Local access is provided by various roadways in the vicinity of the site. The north-south roadways which will be most affected by the project includes Sheep Creek Road, Valle Vista Road and Johnson Road. The east-west roadways which will be most affected by the project include Yucca Terrace Drive, Phelan Road, and Nielson Road.

B. Existing Volumes

Figure 5 depicts the Existing average daily traffic volumes. The Existing average daily traffic volumes were factored from peak hour counts (see Appendix C) obtained by Kunzman Associates, Inc. using the following formula for each intersection leg:

$$\text{PM Peak Hour (Approach Volume + Exit Volume)} \times 11.5 = \text{Daily Leg Volume.}$$

This is a conservative estimate and may overestimate the average daily traffic volumes.

Existing intersection traffic conditions were established through morning and evening peak hour traffic counts obtained by Kunzman Associates from December 2014 (see Appendix C) and shown on Figures 6 and 7, respectively. Explicit peak hour factors have been calculated using the data collected for this effort as well. The morning and evening peak hour traffic volumes were identified by counting the two hour periods from 7:00 AM – 9:00 AM and 4:00 PM – 6:00 PM.

In addition, truck classification counts were conducted at the study area intersections. The existing percent of trucks were used in the conversion of trucks to Passenger Car Equivalent's (see Appendix D).

C. Existing Level of Service

The Existing delay and Level of Service for intersections in the vicinity of the project are shown in Table 1. For Existing traffic conditions, the study area intersections currently operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that currently operate at Level of Service D² or worse during the peak hours:

² Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

Existing delay worksheets are provided in Appendix F.

D. Existing Traffic Signal Warrant Analysis

A traffic signal appears to be currently warranted at the following study area intersection for Existing traffic conditions (see Appendix G):

Clovis Road (NS) at:
Phelan Road (EW) - #2

The unsignalized intersection has been evaluated for a traffic signal using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual of Uniform Traffic Control Devices (November 2014).

E. Planned Transportation Improvements and Relationship to General Plan

The County of San Bernardino General Plan Circulation Element is shown on Figure 8. Existing and future roadways are included in the Circulation Element of the General Plan and are graphically depicted on Figure 8. This figure shows the nature and extent of arterial highways that are needed to adequately serve the ultimate development depicted by the Land Use Element of the General Plan. The County of San Bernardino General Plan roadway cross-sections are shown on Figure 9.

¹ When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane, there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; d = De Facto Right Turn Lane.

² Delay and level of service has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the Highway Capacity Manual, overall average for intersection delay and level of service are shown for intersections with traffic signal or all way stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

³ TS = Traffic Signal; CSS = Cross Street Stop

III. PROJECT TRIPS

A. Project Description

The project site is proposed to be developed with a commercial shopping center with 9 buildings totaling 77,817 square feet for multi-tenant restaurant, service station, retail and retail on a vacant 10 acre parcel currently zoned as general commercial.

B. Trip Generation

The trips generated by the project are determined by multiplying an appropriate trip generation rate by the quantity of land use. Trip generation rates are predicated on the assumption that energy costs, the availability of roadway capacity, the availability of vehicles to drive, and life styles remain similar to what are known today. A major change in these variables may affect trip generation rates.

Trip generation rates were determined for daily trips, morning peak hour inbound and outbound trips, and evening peak hour inbound and outbound trips for the proposed land uses. By multiplying the trip generation rates by the land use quantities, the traffic volumes are determined. Table 2 shows the project trip generation based upon rates obtained from the Institute of Transportation Engineers, Trip Generation Manual, 9th Edition, 2012.

As shown in Table 2, the proposed development is projected to generate a total of approximately 8,895 daily vehicle trips, 268 which will occur during the morning peak hour and 453 of which will occur during the evening peak hour.

It should be noted that for the project land uses, a portion of the trips would come from pass-by trips, trips that are currently on the roadway system. The traffic volumes from the shopping center/fast food restaurant/service station land uses have been reduced as a result of pass-by trips.

Traffic volumes shown in Table 2 consist of the total trips generated for each project land use. As a restaurant/service station trip generated by the project will also be making trips to the commercial retail land use within the project, a double counting of those trips occurs. In order to analyze a “conservative” scenario in terms of the assignment of trips, the traffic volumes from the project site have not been reduced as a result of internal interaction between the proposed land uses.

C. Trip Distribution

The San Bernardino Transportation Analysis Model has been used to evaluate the regional distribution of project trips. A select zone (trip distribution) analysis was performed using the San Bernardino Transportation Analysis Model with the assistance of Southern California Association of Governments staff. The socio-economic data inputs to the San Bernardino Transportation Analysis Model are representative of the planned project development intensity. Figures 10 and 11 contain the directional distributions of the project trips for the proposed land uses.

D. Trip Assignment

Based on the identified trip generation and distributions, project average daily traffic volumes have been calculated and shown on Figures 12 to 19 for Opening Year (2017) to Opening Year (2024), respectively. Morning and evening peak hour intersection turning movement volumes expected from the project are shown on Figures 20 to 35, respectively for Opening Year (2017) to Opening Year (2024).

E. Traffic Contribution Test

No analysis is required further than 5 miles from the project site. The roadway elements that must be analyzed are dependent on both the analysis year (Opening Year or Horizon Year) and project generated traffic volumes. The identification of the study area, and the intersections and highway segments requiring analysis, was based on an estimate of the two-way traffic volumes on the roadway segments near the project site. All arterial segments have been included in the analysis when the anticipated project volume equals or exceeds 50 two-way trips in the peak hours. The requirement is 100 two-way peak hour trips for freeways.

For Opening Year (2017), Figure 36 graphically depicts the project trip contribution test volumes on all of the roadways segments adjacent to the potential intersection analysis locations previously identified, until the project volume contribution has clearly dropped below the 10 trip threshold for significant impact of intersections which currently operate at Level of Service E.

For Opening Year (2024), Figure 37 graphically depicts the project trip contribution test volumes on all of the roadways segments adjacent to the potential intersection analysis locations previously identified, until the project volume contribution has clearly dropped below the 50 trip threshold and 100 trip threshold.

F. Freeway Evaluation

The project does not contribute trips greater than the freeway threshold volume of 100 two-way peak hour trips. The project does contribute trips greater than the arterial link threshold volume of 50 two-way trips in the morning and evening peak hours in the County of San Bernardino.

Opening Year (2018) Project Traffic Contribution Test Volumes

IV. FUTURE CONDITIONS

A. Traffic Volume Contributions

1. Method of Projection

To assess Opening Year traffic conditions, project trips are combined with existing traffic, areawide growth, and other development. For this analysis, the Opening Year (2017) traffic volumes include the project related trips for Major A and Shops 1, 100% of the other development trips located at the northwest corner of Sierra Vista and Phelan Roads as well as 50% of the other development trips located at the northeast corner of Sheep Creek and Phelan Roads. The Opening Year (2024) traffic volumes are for 100% of the proposed project and other development volumes.

2. Areawide Growth

To account for areawide growth on roadways, the future without project daily and peak hour directional roadway segment volume forecasts have been determined using the growth increment approach on the San Bernardino Transportation Analysis Model Year 2008 and Horizon Year (2035) peak hour volumes.

3. Other Development (Near Future)

Potential other developments within the study area are included in the analysis if they are not currently built, they are approved, their approval has not expired, and they would contribute trips to the study area intersections. The San Bernardino Transportation Analysis Model, used to determine background traffic, projects traffic volumes based on the projected job/housing table for a particular zone and generates trips at the zone level. Since the model does not recognize development on a project or parcel basis, these developments are included to provide a comprehensive analysis for growth augmentation of the San Bernardino Transportation Analysis Model data.

Table 3 lists the proposed land uses for the nearby development (see Figure 38). Table 3 shows the daily and peak hour vehicle trips generated by the other development in the study area. Other development trip distributions are shown on Figures 39 to 42. Opening Year other development average daily traffic volumes are shown on Figures 43 and 44. Opening Year other development morning and evening peak hour turning movement volumes are shown on Figures 45 to 48.

B. Future Volumes

As described within Analysis Methodology Section, the Horizon Year (2035) average daily traffic volume forecasts with the project are developed using a growth increment process based on volumes predicted by the San Bernardino Transportation Analysis Model Year 2008 and Year 2035 traffic models. The growth increment for Horizon Year (2035) on each roadway segment is the increase in traffic model volumes from existing Year 2014 to Year 2035. The final Horizon Year (2035) roadway segment volume used for analysis purposes is

then determined by adding the Horizon Year (2035) growth increment volume to the existing counted volume.

1. Existing Plus Project

The average daily traffic volumes for Existing Plus Project traffic conditions have been determined. Existing Plus Project average daily traffic volumes are shown on Figure 49.

2. Opening Year (2017) Without and With Project

The average daily traffic volumes for Opening Year (2017) traffic conditions have been determined as described above using the growth interpolation process for background traffic and is combined other development traffic. Opening Year (2017) Without and With Project average daily traffic volumes are shown on Figure 50.

3. Opening Year (2018) Without and With Project

The average daily traffic volumes for Opening Year (2018) traffic conditions have been determined as described above using the growth interpolation process for background traffic and is combined other development traffic. Opening Year (2018) Without and With Project average daily traffic volumes are shown on Figure 51.

4. Opening Year (2019) Without and With Project

The average daily traffic volumes for Opening Year (2019) traffic conditions have been determined as described above using the growth interpolation process for background traffic and is combined other development traffic. Opening Year (2019) Without and With Project average daily traffic volumes are shown on Figure 52.

5. Opening Year (2020) Without and With Project

The average daily traffic volumes for Opening Year (2020) traffic conditions have been determined as described above using the growth interpolation process for background traffic and is combined other development traffic. Opening Year (2020) Without and With Project average daily traffic volumes are shown on Figure 53.

6. Opening Year (2021) Without and With Project

The average daily traffic volumes for Opening Year (2021) traffic conditions have been determined as described above using the growth interpolation process for background traffic and is combined other development traffic. Opening Year (2021) Without and With Project average daily traffic volumes are shown on Figure 54.

7. Opening Year (2022) Without and With Project

The average daily traffic volumes for Opening Year (2022) traffic conditions have been determined as described above using the growth interpolation process for

background traffic and is combined other development traffic. Opening Year (2022) Without and With Project average daily traffic volumes are shown on Figure 55.

8. Opening Year (2023) Without and With Project

The average daily traffic volumes for Opening Year (2022) traffic conditions have been determined as described above using the growth interpolation process for background traffic and is combined other development traffic. Opening Year (2022) Without and With Project average daily traffic volumes are shown on Figure 56.

9. Opening Year (2024) Without and With Project

The average daily traffic volumes for Opening Year (2024) traffic conditions have been determined as described above using the growth interpolation process for background traffic and is combined other development traffic. Opening Year (2024) Without and With Project average daily traffic volumes are shown on Figure 57.

10. Horizon Year (2035) Without and With Project

The average daily traffic volumes for Horizon Year (2035) traffic conditions have been determined as described above using the growth increment process for background traffic and is combined other development traffic. Horizon Year (2035) Without and With Project average daily traffic volumes are shown on Figure 58.

C. Future Level of Service

Study area intersection delay and level of service values are shown based on existing geometrics (without improvement) and with improvements when the intersection level of service falls below the Level of Service threshold set by the County of San Bernardino. The Existing Plus Project traffic operations analysis is summarized in Table 4. Morning and evening peak hour traffic operations analysis are summarized in Tables 5 to 22 for Opening Year (2017), Opening Year (2018), Opening Year (2019), Opening Year (2020), Opening Year (2021), Opening Year (2022), Opening Year (2034), Opening Year (2024), and the Horizon Year (2035) traffic conditions. Intersection delay calculation worksheets for the various traffic conditions are provided in Appendix F.

1. Existing Plus Project

The Existing Plus Project delay and Level of Service for the study area intersections are shown in Table 4. Table 4 shows delay values based on the geometrics at the study area intersections without and with improvements. Existing Plus Project morning and evening peak hour intersection turning movement volumes are shown on Figures 59 and 60, respectively.

For Existing Plus Project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the

following study area intersections are projected to operate at Level of Service D³ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

Intersection delay calculation worksheets for the various traffic conditions are provided in Appendix F.

2. Opening Year (2017) Without Project

The Opening Year (2017) delay and Level of Service for the study area intersections without the proposed project are shown in Table 5. Table 5 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2017) without project morning and evening peak hour intersection turning movement volumes are shown on Figures 61 and 62, respectively.

For Opening Year (2017) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service D³ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2017) without project traffic conditions, the Valle Vista Road/Phelan Road intersection is projected to continue to operate at Level of Service D during the evening peak hour, without improvements.

3. Opening Year (2017) With Project

The Opening Year (2017) delay and Level of Service for the study area intersections with the proposed project are shown in Table 6. Table 6 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2017) with project morning and evening peak hour intersection turning movement volumes are shown on Figures 63 and 64, respectively.

For Opening Year (2017) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service D³ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

³ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

For Opening Year (2017) with project traffic conditions, the Valle Vista Road/Phelan Road intersection is projected to continue to operate at Level of Service D during the evening peak hour, without improvements. Project generated trips did not result in a significant impact at these intersections as it is projected to not deteriorate the previously existing without project Levels of Service.

4. Opening Year (2018) Without Project

The Opening Year (2018) delay and Level of Service for the study area intersections without the proposed project are shown in Table 7. Table 7 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2018) without project morning and evening peak hour intersection turning movement volumes are shown on Figures 65 and 66, respectively.

For Opening Year (2018) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service E⁴ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2018) without project traffic conditions, the Valle Vista Road/Phelan Road intersection is projected to operate within acceptable Levels of Service during the peak hours, with improvements. Phased project improvements would maintain the existing Level of Service D.

5. Opening Year (2018) With Project

The Opening Year (2018) delay and Level of Service for the study area intersections with the proposed project are shown in Table 8. Table 8 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2018) with project morning and evening peak hour intersection turning movement volumes are shown on Figures 67 and 68, respectively.

For Opening Year (2018) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service E⁴ during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

⁴ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

For Opening Year (2018) without project traffic conditions, the Valle Vista Road/Phelan Road intersection is projected to operate within acceptable Levels of Service during the peak hours, with improvements. Phased project improvements would maintain the existing Level of Service D.

6. Opening Year (2019) Without Project

The Opening Year (2019) delay and Level of Service for the study area intersections without the proposed project are shown in Table 9. Table 9 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2019) without project morning and evening peak hour intersection turning movement volumes are shown on Figures 69 and 70, respectively.

For Opening Year (2019) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service E⁵ during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2019) without project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

7. Opening Year (2019) With Project

The Opening Year (2019) delay and Level of Service for the study area intersections with the proposed project are shown in Table 10. Table 10 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2019) with project morning and evening peak hour intersection turning movement volumes are shown on Figures 71 and 72, respectively.

For Opening Year (2019) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service E⁵ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2019) with project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

⁵ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

8. Opening Year (2020) Without Project

The Opening Year (2020) delay and Level of Service for the study area intersections without the proposed project are shown in Table 11. Table 11 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2020) without project morning and evening peak hour intersection turning movement volumes are shown on Figures 73 and 74, respectively.

For Opening Year (2020) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service E⁶ during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2020) without project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

9. Opening Year (2020) With Project

The Opening Year (2020) delay and Level of Service for the study area intersections with the proposed project are shown in Table 12. Table 12 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2020) with project morning and evening peak hour intersection turning movement volumes are shown on Figures 75 and 76, respectively.

For Opening Year (2020) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service E⁶ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2020) with project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

⁶ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

10. Opening Year (2021) Without Project

The Opening Year (2021) delay and Level of Service for the study area intersections without the proposed project are shown in Table 13. Table 13 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2021) without project morning and evening peak hour intersection turning movement volumes are shown on Figures 77 and 78, respectively.

For Opening Year (2021) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service E⁷ during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2021) without project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

11. Opening Year (2021) With Project

The Opening Year (2021) delay and Level of Service for the study area intersections with the proposed project are shown in Table 14. Table 14 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2021) with project morning and evening peak hour intersection turning movement volumes are shown on Figures 79 and 80, respectively.

For Opening Year (2021) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service E⁷ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2021) with project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

⁷ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

12. Opening Year (2022) Without Project

The Opening Year (2022) delay and Level of Service for the study area intersections without the proposed project are shown in Table 15. Table 15 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2022) without project morning and evening peak hour intersection turning movement volumes are shown on Figures 81 and 82, respectively.

For Opening Year (2022) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service E⁸ during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2022) without project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

13. Opening Year (2022) With Project

The Opening Year (2022) delay and Level of Service for the study area intersections with the proposed project are shown in Table 16. Table 16 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2022) with project morning and evening peak hour intersection turning movement volumes are shown on Figures 83 and 84, respectively.

For Opening Year (2022) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service E⁸ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2022) with project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

⁸ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

14. Opening Year (2023) Without Project

The Opening Year (2023) delay and Level of Service for the study area intersections without the proposed project are shown in Table 17. Table 17 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2023) without project morning and evening peak hour intersection turning movement volumes are shown on Figures 85 and 86, respectively.

For Opening Year (2023) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service E⁹ during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2023) without project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

15. Opening Year (2023) With Project

The Opening Year (2023) delay and Level of Service for the study area intersections with the proposed project are shown in Table 18. Table 18 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2023) with project morning and evening peak hour intersection turning movement volumes are shown on Figures 87 and 88, respectively.

For Opening Year (2023) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service E⁹ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2023) with project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

⁹ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

16. Opening Year (2024) Without Project

The Opening Year (2024) delay and Level of Service for the study area intersections without the proposed project are shown in Table 19. Table 19 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2024) without project morning and evening peak hour intersection turning movement volumes are shown on Figures 89 and 90, respectively.

For Opening Year (2024) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service E¹⁰ during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2024) without project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

17. Opening Year (2024) With Project

The Opening Year (2024) delay and Level of Service for the study area intersections with the proposed project are shown in Table 20. Table 20 shows delay values based on the geometrics at the study area intersections without and with improvements. Opening Year (2024) with project morning and evening peak hour intersection turning movement volumes are shown on Figures 91 and 92, respectively.

For Opening Year (2024) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service E¹⁰ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2024) with project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

¹⁰ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

18. Horizon Year (2035) Without Project

The Horizon Year (2035) delay and Level of Service for the study area intersections without the proposed project are shown in Table 21. Table 21 shows delay values based on the geometrics at the study area intersections without and with improvements. Horizon Year (2035) without project morning and evening peak hour intersection turning movement volumes are shown on Figures 93 and 94, respectively.

For Horizon Year (2035) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service D to F during the peak hours, without improvements:

Clovis Road (NS) at:
Phelan Road (EW) - #2¹¹

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Horizon Year (2035) without project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

19. Horizon Year (2035) With Project

The Horizon Year (2035) delay and Level of Service for the study area intersections with the proposed project are shown in Table 22. Table 22 shows delay values based on the geometrics at the study area intersections without and with improvements. Horizon Year (2035) with project delay calculation worksheets are provided in Appendix F. Horizon Year (2035) with project morning and evening peak hour intersection turning movement volumes are shown on Figures 95 and 96, respectively.

For Horizon Year (2035) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service D to F during the peak hours, without improvements:

Clovis Road (NS) at:
Phelan Road (EW) - #2¹¹

¹¹ Per the Highway Capacity Manual, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown for intersections with stop control. The minor private commercial driveway has Level of Service D. However, the major public roadway (Phelan Road) and the minor public roadway (Clovis Road) have Levels of Service A and C respectively.

Sierra Vista Road (NS) at:
Phelan Road (EW) - #5

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Horizon Year (2035) with project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

D. Future Traffic Signal Warrant Analysis

A traffic signal is projected to be warranted at the following additional study area intersection for Opening Year (2019) With Project traffic conditions (see Appendix G):

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

The unsignalized intersection has been evaluated for a traffic signal using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual of Uniform Traffic Control Devices (November 2014).

Per the Highway Capacity Manual, overall average for intersection delay and level of service are shown for intersections with traffic signal or all way stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

³ TS = Traffic Signal; CSS = Cross Street Stop

⁴ CSS-**R** = Cross street stop lane restricts implemented to improve level of service.

⁵ Existing Two-Way Left Turn Lane.

¹ When a right turn lane is designated, the lane can either be striped or unstriped. To function as a right turn lane, there must be sufficient width for right turning vehicles to travel outside the through lanes. L = Left; T = Through; R = Right; d = De Facto Right Turn Lane; **Bold** = Improvements.

² Delay and level of service has been calculated using the following analysis software: Traffix, Version 7.9.0215 (2008). Per the Highway Capacity Manual, overall average for intersection delay and level of service are shown for intersections with traffic signal or all way stop control, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown.

³ TS = Traffic Signal; CSS = Cross Street Stop

⁴ Existing Two-Way Left Turn Lane.

V. OTHER TRAFFIC CONSIDERATIONS

A. Site Access Analysis

All project driveway access driveways shall provide adequate driveway length in accordance with the County standards. The maximum outbound volume for any one of the project driveways on Phelan Road is 45 vehicles per hour, and the minimum driveway length should adequately accommodate this volume per County standards.

All project access driveways with right turn inbound volumes of 20 vehicles per hour will be reviewed for a turn deceleration lane. The maximum inbound right turn volume for any one of the project driveways is 34 vehicles. The westbound traffic volume for Phelan Road exceeds 600 for existing traffic conditions, therefore, a right turn deceleration lane is recommended on the north side of the project adjacent to Phelan Road. The southbound traffic volume for Valle Vista Road is below 100, therefore, no right turn deceleration lane is recommended.

All project access driveways appear to provide adequate spacing between driveways and between driveways and the curb return of the main roadway. See San Bernardino County Road Planning and Design Standards Manual, Driveway Spacing Figure 6-1 for further detail.

The two western project driveway accesses on Phelan Road are full access driveways with no turning restrictions. The eastern project driveway on Phelan Road is a right turn in right turn out because of its proximity to the intersection. The north project driveway on Valle Vista Road is a full access driveway with no turning restrictions. The south project driveway on Valle Vista Road is a right turn in right turn out limited access driveway because of sight distance issues with the existing roadway alignment south of the project.

B. Left Turn Storage Lane Evaluation

Typically for signalized intersections, a left turn lane is needed for conditions with more than 100 turning vehicles per hour, and dual left turn lanes are recommended if the left turn volume exceeds 300 vehicles per hour during the peak hour. In general, right turn traffic delays are less critical than left turn delays. However, right turn storage lanes can be justified on the basis of capacity analysis and accident records. Right turn and left turn storage lengths are determined using the same methodology.

The recommended minimum acceptable design length for a turn storage length is 150 feet for arterials with speeds greater than 45 miles per hour. The recommended maximum single turn storage length shall be 300 feet; therefore, dual left hand turn lanes should be used when over 300 feet of storage is required or when necessary to provide acceptable levels of service at the intersection. For local streets and driveways, smaller storage lengths are permitted when volumes permit. For unsignalized intersections, the “rule of thumb” storage length is to be one foot for each vehicle per hour turning left during the peak hour.

Required storage lengths have been calculated based on the guidelines provided in the California Department of Transportation Highway Design Manual, Section 405.2. For

unsignalized intersections, the required storage length is calculated as the number of turning vehicles likely to arrive in an average 2-minute period during the peak hour. For signalized intersections, the required storage length is calculated based on 2 times the average turning vehicles per cycle. This provides a storage length to accommodate all turn arrivals during the peak hour 95 percent of the time. A minimum of 2 passenger cars should be provided at 25 feet per vehicle (50 feet minimum storage length).

Unsignalized

$[LTV \text{ (vehicles per hour)} \times (2 \text{ minutes}) \times (\text{hour}/60 \text{ min})] \times 25 \text{ feet per vehicle}$
= Length for 2 minutes

Signalized

$[LTV \text{ (vehicles per hour)} \times (\text{Cycle sec}) \times (\text{hour}/3600 \text{ sec})] \times 25 \text{ feet per vehicle} \times 2 = \text{Length per cycle}$

Left turn storage lengths were analyzed at Phelan Road and Valle Vista Road to verify the storage capacity for the proposed project. Left turn storage should be provided at a length to allow for adequate storage of turning vehicles during the peak hours for Horizon Year (2035) With Project traffic conditions. See Table 23 for calculated storage lengths and actual storage lengths.

The eastbound two-way left turn lane should be reconfigured to provide a dedicated eastbound left turn lane with an adequate storage capacity length. The existing westbound left turn storage at the Phelan Road and Valle Vista Road intersection is currently 50 feet in length and appears to currently provide adequate storage for turning vehicles during the peak hours; however this left turn storage length is inadequate for Horizon Year (2035) traffic conditions. A westbound lane should be added to provide a dedicated westbound left turn lane with an adequate storage capacity length. The northbound left turn volume for Horizon Year (2035) traffic conditions is projected to exceed the 100 vehicle threshold for providing a dedicated left turn lane. A northbound left turn lane should be provided with an adequate storage capacity length to provide for turning vehicles during the peak hours.

C. Sight Distance Analysis

Sight distance is the continuous length of roadway visible to the driver. Two types of sight distance are considered for this driveway: (1) Stopping sight distance is the minimum distance required by the driver on the major approach (or roadway) traveling at a given speed to bring the vehicle to a stop after an object on the road becomes visible. Stopping sight distance is measured from the driver's eye, which is located 42 inches about the pavement to an object that is 6 inches above the pavement; (2) Corner sight distance is the minimum distance required by the driver of a vehicle exiting the driveway to enter the lanes of traffic without requiring the approach traffic traveling at a given speed to radically alter their speed or trajectory. Corner sight distance is measured from the driveway driver's eye, which is located 42 inches about the pavement to an object that is 51 inches above the pavement in the center of the approach lane (such as an on-coming vehicle).

The proposed project driveways on Valle Vista Road will be controlled with a stop sign, which stops vehicles when exiting the driveway. The Valle Vista Road is a two-lane undivided roadway adjacent to the proposed site with a 90-degree horizontal curve south of the proposed project. The posted speed limit along Valle Vista Road at the curve is 15 miles per hour with a curve warning sign and speed limit plaque to the southbound and westbound directions. Radar speed surveys for northbound and southbound Valle Vista Road were obtained by Kunzman Associates, Inc. in April 2015 to determine the actual vehicle travel speeds. The radar speed survey worksheets are included in Appendix H.

Based upon the radar speed survey, the 85th percentile vehicle speed on Valle Vista Road is 34 miles per hour in the southbound direction and 34 miles per hour in the northbound direction. The 85th percentile speed is defined as the speed at or below 85 percent of the drivers on a particular roadway segment.

Based upon the radar speed survey, the sight distance analysis assumes that the vehicles are traveling at 34 miles per hour along Valle Vista Road adjacent to the proposed development.

In addition to the project driveways on Valle Vista Road, the western shared driveway on Phelan Road was also reviewed for sight distance as the adjacent project to the west of the proposed development will be offset from the added drop lane installed by the proposed project.

Figures 97 to 99 show the summary for the sight distance analysis.

1. Stopping Sight Distance Analysis

The stopping sight distance minimum required distance is per Table 201.1 in the Highway Design Manual for a driver approaching on the major roadway to see a vehicle exiting from the minor roadway at the prevailing speed.

The posted speed limit along Valle Vista Road at the horizontal curve is 15 miles per hour. The assumed vehicle speed along Valle Vista Road is 34 miles per hour based on the radar speed survey resulting in a stopping sight distance of 250 feet. The posted speed on Phelan Road is 45 miles per hour, and using 50 miles per hour as the prevailing speed the stopping sight distance is 430 feet.

2. Corner Sight Distance Analysis

The corner sight distance minimum requirement is per Table 405.1A in the Highway Design Manual for the driver to exit from the minor approach onto the major approach which has a given speed. Corner sight distance accounts the distance needed to detect an approaching vehicle and maneuver from a stopped position into the local roadway for vehicles exiting the project.

The posted speed limit along Valle Vista Road at the horizontal curve is 15 miles per hour. The assumed vehicle speed along Valle Vista Road is 34 miles per hour based on the radar speed survey resulting in a corner sight distance of 385 feet. The posted

speed on Phelan Road is 45 miles per hour, and using 50 miles per hour as the prevailing speed the corner sight distance is 550 feet.

3. Restricted Use Area

The area between the line of sight and the centerline of the nearest approaching lane is defined as the limited use area. No objects within the limited use areas should exceed the maximum height of eighteen (18) inches to insure a clear line of sight. The limited use area should be kept clear of obstructions, including landscaping over 18 inches to allow better visibility.

Figures 97 and 99 show the summary of the sight distance analysis for Valle Vista Road at the proposed project driveways for vehicles exiting the project site. The stopping sight distance, corner sight distance and the restricted use area for sight distance are shown. As shown on Figure 97, the north project driveway at Valle Vista Road provides adequate stopping and corner sight distance per the sight distance analysis for both north and south directions. As shown on Figure 98, the south project driveway at Valle Vista Road provides adequate stopping and corner sight distance per the sight distance analysis for the north direction, but does not provide adequate sight distance on the south side because of obstructions in the line of sight and the roadway horizontal curve. As shown on Figure 99, the western project driveway on Phelan Road provides adequate stopping and corner sight distance per the sight distance analysis for the west direction, but does not provide adequate sight distance on the east side because of obstructions in the limited use area.

To mitigate the sight distance concern for project access driveways the southern project driveway on Valle Vista Road will be limited access and the western project driveway on Phelan Road will have a no parking restriction on the curb in the limited use area. The south project driveway on Valle Vista Road shall be a right turn in right turn out limited access driveway because of sight distance issues with the existing roadway alignment south of the project. A no-parking zone should be established for the Phelan Road from 20 feet east to 110 feet west of western driveway. No-parking signs or red curbing should be installed to help with the line of sight for vehicles approaching driveways as well as vehicles exiting the driveways.

D. Platoon Flow at Adjacent Intersections

When a two way stop control intersection is located close to a traffic signal, the capacity and/or the delay can be affected by the organized platoon flow of vehicles leaving the adjacent upstream signalized intersection. The platooning effect of the traffic signal will provide for larger gaps in mainline flow which improves adjacent cross-street capacity and lessens delay. The degree of the effect will vary based on the distance to the signal, volume of the mainline flow, signal timing and lane configuration. Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection, the effects of platooning vehicles was also analyzed. The Clovis Road and Phelan Road intersection was projected to operate with less delay when the adjacent traffic signal is included in the analysis.

VI. PROJECT MITIGATION

A. Required Improvements and Costs

Improvements that will eliminate all anticipated roadway operational deficiencies throughout the study area have been identified for Existing Plus Project, Opening Year (2017), Opening Year (2018), Opening Year (2019), Opening Year (2020), Opening Year (2021), Opening Year (2022), Opening Year (2024), and Horizon Year (2035) traffic conditions. The improvements were determined through the operations analysis of Section IV.

The approximate costs for the Horizon Year (2035) improvements have generally been estimated using cost guidelines in the Congestion Management Program Handbook (see Appendix J). A unit cost of \$598,500 has been obtained from County of San Bernardino staff for the installation of a traffic signal and has been substituted for the lower value cited in the Congestion Management Program materials. For adding a through lane, a unit cost of \$290,000 has been assumed. For adding a turn lane, a unit cost of \$50,000 has been assumed.

The needed improvements and resulting costs are summarized in Table 24 for the study area intersections for both the Project Only and Other Development Only (if applicable) Conditions. The exclusive and mutual improvement costs are listed at the bottom of Table 24.

The total cost of needed and unfunded intersection improvements is \$1,367,000. As shown in Table 24, the project's identified intersection improvement costs are \$768,500 and is specified by year/phase of construction required.

B. Project Contribution and Pro-Rata Costs

The project Pro-Rata contributions have also been calculated for Horizon Year (2035) improvement locations. The project share of cost has been based on the proportion of project peak hour traffic contributed to the improvement location relative to the total new peak hour Horizon Year (2035) traffic volume.

This area of Phelan is currently included in the High Desert Local Area Transportation Facilities Plan. The high desert development funding is used for improvements specified by the plan. High Desert Local Area Transportation Plan includes widening Phelan Road to a 6 lane roadway section. Improvements for lane widening and future traffic signals within the study area are included in the Project Pro-Rata Traffic Contribution and Cost in Table 25.

Table 25 presents a summary of improvement cost and project cost shares at the Horizon Year (2035) intersection improvement locations. The intersection Pro-Rata cost calculations are based on the highest of the morning or evening peak hour traffic volumes. As shown in Table 25, the project's identified pro-rata intersection costs for local improvements are \$169,575.

The project shall construct Valle Vista Road/Phelan Road improvements as noted on Table 24; however for the lane widening items they may apply for a fee credit based on the pro-rata costs listed in Table 25. The project shall contribute to the future traffic signal at Clovis Road/Phelan Road intersection and Phelan Road roadway widening at Sierra Vista Road/Phelan Road intersection as noted on Table 24 and 25.

The dollar amounts are rough order of magnitude estimates only. They are intended only for the discussion purposes of this traffic impact analysis, and do not imply any legal responsibility or formula for contributions or mitigation.

As mitigation for the potential traffic impacts, the proposed project shall contribute through an adopted traffic impact fee program in addition to any contributions shown within the traffic study which is not covered within this fee program.

Table 24

Summary of Intersection Improvements and Costs

Intersection	Jurisdiction	Improvement	Cost Estimate ¹
<u>Opening Year (2018) Phase 2</u>			
Valle Vista Road (NS) at: Phelan Road (EW) - #8	SB County	Add NB Left Turn Lane ²	\$50,000
		Add SB Left Turn Lane ²	\$50,000
		Add EB Left Turn Lane (striping modification) ²	\$10,000 ^{3,4}
		Add WB Right Turn Lane ²	\$50,000 ^{3,4}
		Lengthen WB Left Turn Lane (striping modification) ²	\$10,000 ^{3,4}
Opening Year (2018) Phase 2 Total			\$170,000
<u>Opening Year (2019) Phase 3</u>			
Valle Vista Road (NS) at: Phelan Road (EW) - #8	SB County	Install Traffic Signal ²	\$598,500
<u>Horizon Year (2035)</u>			
Clovis Road (NS) at: Phelan Road (EW) - #2	SB County	Install Traffic Signal	- ⁵
Sierra Vista Road (NS) at: Phelan Road (EW) - #5	SB County	Add WB Right-Through Shared Lane (striping modification)	- ⁶
Project Improvements - Opening Year (2017)			None
Project Improvements - Opening Year (2018)			\$170,000
Project Improvements - Opening Year (2019)			\$598,500
Total			\$768,500

¹ Cost estimate based on values from the [Appendix G Preliminary Construction Cost Estimates For Congestion Management Plan](#), San Bernardino Association of Governments (2003). Costs estimates are sensitive to the quantity and location of work specified for a given installation. These values represent the relative magnitude of the cost and should be verified through the bidding process.

² Project related improvement to mitigate direct impacts and improve level of service.

³ Improvements covered by the High Desert Local Transportation fee program are collected at a pro-rata basis shown in Table 25.

⁴ Project shall construct Valle Vista Road/ Phelan Road improvements, and may apply for High Desert Local fee credits for widening.

⁵ Contribute to the pro-rata intersection traffic contributions for the future Traffic Signal installation at Clovis Road and Phelan Road intersection. (see Table 25).

⁶ Contribute to the High Desert Local Area Transportation Facilities Plan for Sierra Vista Road and Phelan Road intersection improvements.

Table 25

Project Pro-Rata Intersection Traffic Contribution and Cost¹

Intersection	Jurisdiction	Cost	Peak Hour	Existing Traffic	Year 2035 With Project Traffic	Project Traffic	Total New Traffic	Project % of New Traffic	Project Cost Share
Clovis Road (NS) at: Phelan Road (EW) - #2 ²	SB County	\$598,500	Morning Evening	940 1,209	1,097 1,449	40 68	157 240	25.5% 28.3%	\$ 169,575

Project Pro-Rata Intersection Traffic Contribution Per Phase

Project Phase	% Trips	Intersection #2
Opening Year 2017	21.7%	\$36,813
Opening Year 2018	8.1%	\$13,802
Opening Year 2019	5.9%	\$9,932
Opening Year 2020	22.0%	\$37,232
Opening Year 2021	10.8%	\$18,359
Opening Year 2022	8.4%	\$14,184
Opening Year 2023	18.8%	\$31,818
Opening Year 2024	4.4%	\$7,435
Total	100.0%	\$169,575

¹ Improvements to the Valle Vista Road and Phelan Road intersection adjacent to the project are not included in the total as the applicant will be responsible for construction these improvements. The applicant can apply for reduction in High Desert Transportation fees based on the difference between the fair share assessment and the total installation costs allocated to the project..

² The project will contribute to the future traffic signal within the study area at a pro-rata basis. A traffic signal is projected to be warranted at Clovis Road/Phelan Road (see Appendix F).

VII. CONCLUSIONS AND RECOMMENDATIONS

A. Summary

The traffic issues related to the proposed land use and development have been evaluated in the context of the California Environmental Quality Act.

The County of San Bernardino is the lead agency responsible for preparation of the traffic impact analysis, in accordance with the California Environmental Quality Act authorizing legislation. This report analyzes traffic impacts for the anticipated for the anticipated initial opening date with partial occupancy in Year 2017, final opening date with full occupancy of the development in Year 2024, at which time it will be generating trips at its full potential, and for the Horizon Year (2035).

A series of scoping discussions were conducted with the following agency to define the desired analysis locations for each future analysis year:

- County of San Bernardino

In addition, the San Bernardino Transportation Analysis Model (SBTAM) has been obtained through discussions with the Southern California Association of Governments (SCAG) staff for purposes of this analysis for associated travel patterns.

No analysis is required further than 5 miles from the project site. The roadway elements that must be analyzed are dependent on both the analysis year (Opening Year or Horizon Year) and project generated traffic volumes. The identification of the study area, and the intersections and highway segments requiring analysis, was based on an estimate of the two-way traffic volumes on the roadway segments near the project site. All arterial segments have been included in the analysis when the anticipated project volume equals or exceeds 50 two-way trips in the peak hours. The requirement is 100 two-way peak hour trips for freeways.

The project does not contribute trips greater than the freeway threshold volume of 100 two-way peak hour trips. The project does contribute trips greater than the arterial link threshold volume of 50 two-way trips in the morning and evening peak hours in the County of San Bernardino.

The average daily traffic volume forecasts have been determined using the growth increment approach on the San Bernardino Transportation Analysis Model Year 2008 and Horizon Year (2035) average daily traffic volume forecasts (see Appendix D). This difference defines the growth in traffic over the 27 year period. The incremental growth in average daily traffic volume has been factored to reflect the forecast growth between Year 2014 and Year 2035. For this purpose, linear growth between the Year 2008 base condition and the forecast Year 2035 condition was assumed. Since the increment between Year 2014 and Year 2035 is 21 years of the 27 year time frame, a factor of 0.78 (i.e., 21/27) was used.

The Horizon Year (2035) without project daily and peak hour directional roadway segment volume forecasts have been determined using the growth increment approach on the San Bernardino Transportation Analysis Model Year 2008 and Year 2035 peak hour volumes. The growth increment calculation worksheets are shown in Appendix D. Current peak hour intersection approach/departure data is a necessary input to this approach. The existing traffic count data serves as both the starting point for the refinement process, and also provides important insight into current travel patterns and the relationship between peak hour and daily traffic conditions. The initial turning movement proportions are estimated based upon the relationship of each approach leg's forecast traffic volume to the other legs forecast volumes at the intersection. The initial estimate of turning movement proportions is then entered into a spreadsheet program consistent with the National Cooperative Highway Research Program Report 255. A linear programming algorithm is used to calculate individual turning movements that match the known directional roadway segment volumes computed in the previous step. This program computes a likely set of intersection turning movements from intersection approach counts and the initial turning proportions from each approach leg.

The Opening Year traffic volumes for each phase have been interpolated from the Horizon Year (2035) traffic volumes based upon a portion of the future growth increment.

Project traffic volumes were then added to the San Bernardino Transportation Analysis Model traffic volumes. Quality control checks and forecast adjustments were performed as necessary to ensure that all future traffic volume forecasts reflect a minimum of 10% growth over existing traffic volumes. The result of this traffic forecasting procedure is a series of traffic volumes suitable for traffic operations analysis.

B. Existing Conditions

Regional access to the project site is provided by SR-138 and the I-15 Freeway. Local access is provided by various roadways in the vicinity of the site. The north-south roadway which will be most affected by the project includes Sheep Creek Road, Valle Vista Road and Johnson Road. The east-west roadways which will be most affected by the project includes Yucca Terrace Drive, Phelan Road, and Nielson Road.

For Existing traffic conditions, the study area intersections currently operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that currently operates at Level of Service D¹³ or worse during the peak hours:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

A traffic signal appears to be currently warranted at the following study area intersection for Existing traffic conditions (see Appendix G):

¹³ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

Clovis Road (NS) at:
Phelan Road (EW) - #2

The unsignalized intersection has been evaluated for a traffic signal using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual of Uniform Traffic Control Devices (November 2014).

C. Project Trips

Trip generation rates were determined for daily trips, morning peak hour inbound and outbound trips, and evening peak hour inbound and outbound trips for the proposed land uses. By multiplying the trip generation rates by the land use quantities, the traffic volumes are determined. Table 2 shows the project trip generation based upon rates obtained from the Institute of Transportation Engineers, Trip Generation Manual, 9th Edition, 2012.

The proposed development is projected to generate a total of approximately 8,895 daily vehicle trips, 268 which will occur during the morning peak hour and 453 of which will occur during the evening peak hour.

The San Bernardino Transportation Analysis Model has been used to evaluate the regional distribution of project traffic. A select zone (trip distribution) analysis was performed using the San Bernardino Transportation Analysis Model with the assistance of Southern California Association of Governments staff. The socio-economic data inputs to the San Bernardino Transportation Analysis Model are representative of the planned project development intensity.

D. Future Conditions

Study area intersection delay and level of service values are shown based on existing geometrics (without improvement) and with improvements when the intersection level of service falls below the Level of Service threshold set by the County of San Bernardino. The Existing Plus Project traffic operations analysis is summarized in Table 4. Morning and evening peak hour traffic operations analysis are summarized in Tables 5 to 22 for Opening Year (2017), Opening Year (2018), Opening Year (2019), Opening Year (2020), Opening Year (2021), Opening Year (2022), Opening Year (2034), Opening Year (2024), and the Horizon Year (2035) traffic conditions, and the Horizon Year (2035) traffic conditions.

Intersection delay calculation worksheets for the various traffic conditions are provided in Appendix F.

1. Existing Plus Project

For Existing Plus Project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the

following study area intersection is projected to operate at Level of Service D¹⁴ or worse during the peak hours:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Existing Plus Project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

2. Opening Year (2017) Without Project

For Opening Year (2017) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service D¹⁴ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2017) without project traffic conditions, the Valle Vista Road/Phelan Road intersection is projected to continue to operate at Level of Service D during the evening peak hour, without improvements.

3. Opening Year (2017) With Project

For Opening Year (2017) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service D¹⁴ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2017) with project traffic conditions, the Valle Vista Road/Phelan Road intersection is projected to continue to operate at Level of Service D during the evening peak hour, without improvements. Project generated trips did not result in a significant impact at these intersections as it is projected to not deteriorate the previously existing without project Levels of Service.

¹⁴ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

4. Opening Year (2018) Without Project

For Opening Year (2018) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service D¹⁵ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2018) without project traffic conditions, the Valle Vista Road/Phelan Road intersection is projected to operate within acceptable Levels of Service during the peak hours, with improvements. Phased project improvements would maintain the existing Level of Service D.

5. Opening Year (2018) With Project

For Opening Year (2018) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service E¹⁵ during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2018) without project traffic conditions, the Valle Vista Road/Phelan Road intersection is projected to operate within acceptable Levels of Service during the peak hours, with improvements. Phased project improvements would maintain the existing Level of Service D.

6. Opening Year (2019) Without Project

For Opening Year (2019) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service E¹⁵ during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2019) without project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

¹⁵ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

7. Opening Year (2019) With Project

For Opening Year (2019) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service E¹⁶ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2019) with project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

A traffic signal is projected to be warranted at the following additional study area intersection for Opening Year (2019) with project traffic conditions (see Appendix G):

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

The unsignalized intersection has been evaluated for a traffic signal using the California Department of Transportation Warrant 3 Peak Hour traffic signal warrant analysis, as specified in the California Manual of Uniform Traffic Control Devices (November 2014).

8. Opening Year (2020) Without Project

For Opening Year (2020) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service E¹⁶ during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2020) without project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

9. Opening Year (2020) With Project

For Opening Year (2020) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except

¹⁶ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

for the following study area intersections that are projected to operate at Level of Service E¹⁶ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2020) with project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

10. Opening Year (2021) Without Project

For Opening Year (2021) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service E¹⁷ during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2021) without project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

11. Opening Year (2021) With Project

For Opening Year (2021) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service E¹⁷ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2021) with project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

12. Opening Year (2022) Without Project

For Opening Year (2022) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service E¹⁷ during the peak hours, without improvements:

¹⁷ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2022) without project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

13. Opening Year (2022) With Project

For Opening Year (2022) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service E¹⁸ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2022) with project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

14. Opening Year (2023) Without Project

For Opening Year (2023) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service E¹⁸ during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2023) without project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

15. Opening Year (2023) With Project

For Opening Year (2023) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service E¹⁸ or worse during the peak hours, without improvements:

¹⁸ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2023) with project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

16. Opening Year (2024) Without Project

For Opening Year (2024) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersection that is projected to operate at Level of Service E¹⁹ during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2024) without project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

17. Opening Year (2024) With Project

For Opening Year (2024) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service E¹⁹ or worse during the peak hours, without improvements:

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Opening Year (2024) with project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

18. Horizon Year (2035) Without Project

For Horizon Year (2035) without project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service D or worse during the peak hours, without improvements:

¹⁹ Because of the proximity of the Clovis Road and Phelan Road intersection to the adjacent signalized intersection the effects of platooning vehicles was also analyzed, and this intersection was found to operate at an acceptable level of service.

Clovis Road (NS) at:
Phelan Road (EW) - #2¹⁹

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Horizon Year (2035) without project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

19. Horizon Year (2035) With Project

For Horizon Year (2035) with project traffic conditions, the study area intersections are projected to operate at acceptable Levels of Service during the peak hours, except for the following study area intersections that are projected to operate at Level of Service D or worse during the peak hours, without improvements:

Clovis Road (NS) at:
Phelan Road (EW) - #2¹⁹

Sierra Vista Road (NS) at:
Phelan Road (EW) - #5

Valle Vista Road (NS) at:
Phelan Road (EW) - #8

For Horizon Year (2035) with project traffic conditions, the study area intersections are projected to operate within acceptable Levels of Service during the peak hours, with improvements.

E. Cost Summary

Improvements that will eliminate all anticipated roadway operational deficiencies throughout the study area have been identified for Existing Plus Project, Opening Year (for each phase) and Horizon Year (2035) traffic conditions. The improvements were determined through the operations analysis of Section IV and other traffic considerations of Section V. Tables 26 to 28 summarize the operational analysis for all phases.

The project's identified intersection costs is \$768,500 (see Table 24). The project will provide phased improvement for area intersections which are impacted. The phasing of the improvement and the percent of the cost relative to project related traffic is shown on Tables 24 and 25.

¹⁹ Per the Highway Capacity Manual, the delay and level of service for the worst individual movement (or movements sharing a single lane) are shown for intersections with stop control. The minor private commercial driveway has Level of Service D. However, the major public roadway (Phelan Road) and the minor public roadway (Clovis Road) have Levels of Service A and C respectively.

This area of Phelan is currently included in the High Desert Local Area Transportation Facilities Plan. Improvements for lane widening and future traffic signals within the study area are included in the Project Pro-Rata Traffic Contribution and Cost (see Table 25). The project's identified pro-rata intersection costs for local improvements are \$169,575.

F. Recommendations

The recommendations in this section address on-site improvements, off-site improvements and the phasing of all necessary study area transportation improvements.

1. On-Site Improvements

a) General to all Phases:

1. On-site improvements and improvements adjacent to the site will be required in conjunction with the proposed development to ensure adequate circulation within the project itself (see Figure 100).
2. Sight distance at project accesses should be reviewed with respect to California Department of Transportation/County of San Bernardino standards in conjunction with the preparation of final grading, landscaping, and street improvement plans. The final grading, landscaping, and street improvement plans shall demonstrate that sight distance standards are met. Such plans must be reviewed by the County and approved as consistent with this measure prior to issue of grading permits.
3. On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the project.
4. Construct and maintain primary and secondary access roadways in conjunction with development prior to the opening of the phase which it services.
5. The site should provide sufficient parking spaces to meet County of San Bernardino parking code requirements in order to service on-site parking demand.
6. A no-parking zone should be established for the Phelan Road from 20 feet east to 110 feet west of western driveway. No-parking signs or red curbing should be installed to help with the line of sight for vehicles approaching driveways as well as vehicles exiting the driveways.

b) Opening Year (2017) With Project Phase 1:

Construct Phelan Road from the west project boundary to Valle Vista Road at its ultimate half-section width including sidewalk, landscaping and parkway improvements in conjunction with development.

Construct Valle Vista Road from Phelan Road to the East-north project driveway (#9) (minimum) at its ultimate half-section width including sidewalk, landscaping and parkway improvements in conjunction with development.

c) Opening Year (2022) With Project Phase 6:

Construct Valle Vista Road from East-north project driveway (#9) to the south project boundary at its ultimate half-section width including sidewalk, landscaping and parkway improvements in conjunction with development.

2. Off-Site Improvements

a) General to all Phases:

1. The necessary off-site improvement recommendations were described in previous sections of this report. The project should contribute towards the cost of necessary study area improvements on a fair share or “pro-rata” basis.
2. As is the case for any roadway design, the County of San Bernardino should periodically review traffic operations in the vicinity of the project once the project is constructed to assure that the traffic operations are satisfactory.
3. Participate in the phased construction of off-site traffic signals through payment of traffic signal mitigation fees. The traffic signals within the study area at buildout should specifically include an interconnect of the traffic signals to function in a coordinated system.

b) Opening Year (2018) With Project Phase 2:

Construct additional lanes at Valle Vista Road and Phelan Road (See Table 24):

- Northbound Left Turn Lane on Valle Vista Road
- Southbound Left Turn Lane on Valle Vista Road
- Westbound Right Turn Lane east of Valle Vista Road

Modify existing lanes at Valle Vista Road and Phelan Road (See Table 24):

- Westbound Left Turn Lane east of Valle Vista Road
- Eastbound Left Turn Lane west of Valle Vista Road

c) Opening Year (2019) With Project Phase 3:

Install Traffic Signal improvement at Valle Vista Road and Phelan Road. The traffic signals should include an interconnect of the traffic signals to function in a coordinated system (See Table 24).

d) Horizon Year (2035) Without Project:

Contribute to the pro-rata intersection traffic contributions for the future traffic signal installation at the Clovis Road and Phelan Road intersection. The traffic signals should include an interconnect of the traffic signals to function in a coordinated system (See Table 25).

e) Horizon Year (2035) With Project:

Contribute to the High Desert Local Area Transportation Facilities Plan for Sierra Vista Road and Phelan Road intersection improvements. Modify existing lanes westbound right turn lane east of intersection convert to shared through-right lane at Sierra Vista Road and Phelan Road (See Table 24).

Table 26

¹ LOS = Level of Service.

² TS = Traffic Signal; CSS = Cross Street Stop.

³ When a two way stop control intersection is located close to a traffic signal, the capacity and/or the delay can be affected by the organized platoon flow of vehicles leaving the adjacent upstream signalized intersection. The platooning effect of the traffic signal will provide for larger gaps in mainline flow which improves adjacent cross-street capacity and lessens delay.

The minor private commercial driveway has Level of Service D. However, the major public roadway (Phelan Road) and the minor public roadway (Clovis Road) have Levels of Service A and C respectively.

Figure 100
Circulation Recommendations

A no-parking zone should be established for the Phelan Road from 20 feet east to 110 feet west of western driveway. No-parking signs or red curbing should be installed to help with the line of sight for vehicles approaching driveways as well as vehicles exiting the driveways.

Construct Phelan Road from the west project boundary to Valle Vista Road at its ultimate half-section width including landscaping and parkway improvements in conjunction with development.

The site should provide sufficient parking spaces to meet County of San Bernardino parking code requirements in order to service on-site parking demand.

Sight distance at each project access should be reviewed with respect to California Department of Transportation/County of San Bernardino standards in conjunction with the preparation of final grading, landscaping, and street improvement plans. The final grading, landscaping, and street improvement plans shall demonstrate that sight distance standards are met. Such plans must be reviewed by the County and approved as consistent with this measure prior to issue of grading permits.

On-site traffic signing and striping should be implemented in conjunction with detailed construction plans for the project.

The project should contribute towards the cost of necessary study area improvements on a fair share or "pro-rata" basis.

As is the case for any roadway design, the County of San Bernardino should periodically review traffic operations in the vicinity of the project once the project is constructed to assure that the traffic operations are satisfactory.

Participate in the phased construction of off-site traffic signals through payment of traffic signal mitigation fees. The traffic signals within the study area at buildout should specifically include an interconnect of the traffic signals to function in a coordinated system.

Construct Valle Vista Road from Phelan Road to the south project boundary at its ultimate half-section width including landscaping and parkway improvements in conjunction with development.

APPENDIX A

Glossary of Transportation Terms

GLOSSARY OF TRANSPORTATION TERMS

COMMON ABBREVIATIONS

AC:	Acres
ADT:	Average Daily Traffic
Caltrans:	California Department of Transportation
DU:	Dwelling Unit
ICU:	Intersection Capacity Utilization
LOS:	Level of Service
TSF:	Thousand Square Feet
V/C:	Volume/Capacity
VMT:	Vehicle Miles Traveled

TERMS

AVERAGE DAILY TRAFFIC: The total volume during a year divided by the number of days in a year. Usually only weekdays are included.

BANDWIDTH: The number of seconds of green time available for through traffic in a signal progression.

BOTTLENECK: A constriction along a travelway that limits the amount of traffic that can proceed downstream from its location.

CAPACITY: The maximum number of vehicles that can be reasonably expected to pass over a given section of a lane or a roadway in a given time period.

CHANNELIZATION: The separation or regulation of conflicting traffic movements into definite paths of travel by the use of pavement markings, raised islands, or other suitable means to facilitate the safe and orderly movements of both vehicles and pedestrians.

CLEARANCE INTERVAL: Nearly same as yellow time. If there is an all red interval after the end of a yellow, then that is also added into the clearance interval.

CORDON: An imaginary line around an area across which vehicles, persons, or other items are counted (in and out).

CYCLE LENGTH: The time period in seconds required for one complete signal cycle.

CUL-DE-SAC STREET: A local street open at one end only, and with special provisions for turning around.

DAILY CAPACITY: The daily volume of traffic that will result in a volume during the peak hour equal to the capacity of the roadway.

DELAY: The time consumed while traffic is impeded in its movement by some element over which it has no control, usually expressed in seconds per vehicle.

DEMAND RESPONSIVE SIGNAL: Same as traffic-actuated signal.

DENSITY: The number of vehicles occupying in a unit length of the through traffic lanes of a roadway at any given instant. Usually expressed in vehicles per mile.

DETECTOR: A device that responds to a physical stimulus and transmits a resulting impulse to the signal controller.

DESIGN SPEED: A speed selected for purposes of design. Features of a highway, such as curvature, superelevation, and sight distance (upon which the safe operation of vehicles is dependent) are correlated to design speed.

DIRECTIONAL SPLIT: The percent of traffic in the peak direction at any point in time.

DIVERSION: The rerouting of peak hour traffic to avoid congestion.

FORCED FLOW: Opposite of free flow.

FREE FLOW: Volumes are well below capacity. Vehicles can maneuver freely and travel is unimpeded by other traffic.

GAP: Time or distance between successive vehicles in a traffic stream, rear bumper to front bumper.

HEADWAY: Time or distance spacing between successive vehicles in a traffic stream, front bumper to front bumper.

INTERCONNECTED SIGNAL SYSTEM: A number of intersections that are connected to achieve signal progression.

LEVEL OF SERVICE: A qualitative measure of a number of factors, which include speed and travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience, and operating costs.

LOOP DETECTOR: A vehicle detector consisting of a loop of wire embedded in the roadway, energized by alternating current and producing an output circuit closure when passed over by a vehicle.

MINIMUM ACCEPTABLE GAP: Smallest time headway between successive vehicles in a traffic stream into which another vehicle is willing and able to cross or merge.

MULTI-MODAL: More than one mode; such as automobile, bus transit, rail rapid transit, and bicycle transportation modes.

OFFSET: The time interval in seconds between the beginning of green at one intersection and the beginning of green at an adjacent intersection.

PLATOON: A closely grouped component of traffic that is composed of several vehicles moving, or standing ready to move, with clear spaces ahead and behind.

ORIGIN-DESTINATION SURVEY: A survey to determine the point of origin and the point of destination for a given vehicle trip.

PASSENGER CAR EQUIVALENTS (PCE): One car is one Passenger Car Equivalent. A truck is equal to 2 or 3 Passenger Car Equivalents in that a truck requires longer to start, goes slower, and accelerates slower. Loaded trucks have a higher Passenger Car Equivalent than empty trucks.

PEAK HOUR: The 60 consecutive minutes with the highest number of vehicles.

PRETIMED SIGNAL: A type of traffic signal that directs traffic to stop and go on a predetermined time schedule without regard to traffic conditions. Also, fixed time signal.

PROGRESSION: A term used to describe the progressive movement of traffic through several signalized intersections.

SCREEN-LINE: An imaginary line or physical feature across which all trips are counted, normally to verify the validity of mathematical traffic models.

SIGNAL CYCLE: The time period in seconds required for one complete sequence of signal indications.

SIGNAL PHASE: The part of the signal cycle allocated to one or more traffic movements.

STARTING DELAY: The delay experienced in initiating the movement of queued traffic from a stop to an average running speed through a signalized intersection.

TRAFFIC-ACTUATED SIGNAL: A type of traffic signal that directs traffic to stop and go in accordance with the demands of traffic, as registered by the actuation of detectors.

TRIP: The movement of a person or vehicle from one location (origin) to another (destination). For example, from home to store to home is two trips, not one.

TRIP-END: One end of a trip at either the origin or destination; i.e. each trip has two trip-ends. A trip-end occurs when a person, object, or message is transferred to or from a vehicle.

TRIP GENERATION RATE: The quantity of trips produced and/or attracted by a specific land use stated in terms of units such as per dwelling, per acre, and per 1,000 square feet of floor space.

TRUCK: A vehicle having dual tires on one or more axles, or having more than two axles.

UNBALANCED FLOW: Heavier traffic flow in one direction than the other. On a daily basis, most facilities have balanced flow. During the peak hours, flow is seldom balanced in an urban area.

VEHICLE MILES OF TRAVEL: A measure of the amount of usage of a section of highway, obtained by multiplying the average daily traffic by length of facility in miles.

APPENDIX B

Scoping Agreement

SCOPE FOR TRAFFIC STUDY

Project Name:	VVR, LLC Project Number: P201400342 (APN:3066-251-07)
----------------------	---

This Scope for Traffic Study acknowledges San Bernardino County Department of Public Works, Traffic Division requirements of traffic impact analysis for the project and is subject to change:

Project Address:	SWC of Valle Vista Road and Phelan Road		
Project Description:	76, 473 square feet of Commercial Retail		
City:	County of San Bernardino / Unincorporated Phelan		
Project Buildout Year:	2024	Ambient Growth Rate per Year:	SBTAM
Closest Intersection (Xtn) to the Project

Traffic Division Representative Date

SCOPE FOR TRAFFIC STUDY

Project Name:	VVR, LLC Project Number: P201400342 (APN:3066-251-07)
----------------------	---

1. Traffic Distribution: Please insert or attach Figure(s) illustrating project trip distribution in percentages and volumes at the study intersections analyzed.

See Figures:

- Figure 1 Project Location Map,
- Figure 2 Site Plan
- Figure 3 Project Trip Distribution

2. Trip Credit: Exact amount of credit subject to approval by Traffic Division.

Transportation Demand Management (TDM)	Yes/no	NO
Existing Active Land Use	Yes/no	Vacant
Previous Land Use	Yes/no	Vacant
Internal Trip Reduction	Yes/no	NO
Pass-by Trip Reduction	Yes/no	See Project Trip Generation Table 1

3. Related Projects: Consultant should check with Planning in the San Bernardino County Department of Land Use Services and planning departments of adjoining Cities. Documentation of the consultation from these agencies shall be included in the traffic study. Related projects list shall be submitted to Traffic Division for our review and approval before being incorporated in the study.

4. Freeway Analysis: The potential traffic impact on the following Freeway(s) must be considered.

No

The applicant shall consult with the State of California Department of Transportation (Caltrans) to determine the California Environmental Quality Act levels of significance with regard to traffic impacts on Caltrans' freeway facilities. This consultation shall also include a determination of Caltrans requirements for the study of traffic impacts to its facilities and the mitigation of any such impacts. This analysis must follow the most current Caltrans' Guide for the Preparation of Traffic Impact Studies (December 2002) and can be obtained from <http://www.dot.ca.gov/hq/traffops/developserv/operationalsystems/reports/tiguide.pdf>. If Caltrans finds that the project has a significant impact on the freeway, Caltrans shall be requested to include the basis for this finding in their response. If fees are proposed to mitigate the freeway impact, Caltrans shall be requested to identify the specific project to which the fees will apply. These written comments from Caltrans shall be included with the traffic study and submitted to Public Works for review and approval. If a documented good faith effort is made to consult with Caltrans and written comments cannot be obtained from within a reasonable amount of time, an analysis of the freeway impact shall be made using HCM procedures. Appendix A of the SANBAG CMP outlines allowable modifications to these procedures. The SANBAG CMP can be viewed online at: http://www.sanbag.ca.gov/planning/subr_congestion.html

SCOPE FOR TRAFFIC STUDY

Project Name:	VVR, LLC Project Number: P201400342 (APN:3066-251-07)
----------------------	---

7. Other:

Traffic counts may be conducted immediately per the following:
<ul style="list-style-type: none">• Must be taken on Tuesdays, Wednesdays or Thursdays.
<ul style="list-style-type: none">• Must exclude holidays, and the first weekdays before and after the holiday.
<ul style="list-style-type: none">• Must be taken on days when local schools or colleges are in session.
<ul style="list-style-type: none">• Must be taken on days of good weather, and avoid atypical conditions (e.g., road construction, detours, or major traffic incidents).
<ul style="list-style-type: none">• Traffic counts used for other traffic studies in the area shall NOT be reused again, unless 25% of the counts conducted for that particular traffic study are validated with new counts. The difference in volumes between the old and new counts at each corresponding movement should not be more than 10%.
<ul style="list-style-type: none">• New traffic counts shall be checked to ensure the difference in volumes at corresponding approaches, if applicable, between two adjacent intersections is no more than 10% unless the difference can be justified.
<ul style="list-style-type: none">• For all proposed mitigation measures, a conceptual plan for the improvements shall be submitted to our Traffic Studies section for review and approval prior to the approval of the Traffic Impact Analysis. All proposed improvements shall be within the right-of-way.
<ul style="list-style-type: none">• For all cumulative mitigation measures, a cost estimate for the improvement shall be submitted.

This analysis must follow the most current Traffic Impact Study Guidelines for the County as stated in the County's Road Planning and Design Standards.

8. Fees

The County charges on an actual cost basis for review of traffic studies. An initial deposit of \$3400 is required at the time that a land use application is filed with the Department of Land Use Services. If the review costs exceed the initial deposit, the applicant will be expected to provide additional funds and the review will be suspended until the additional funds are deposited.

APPENDIX F

Explanation and Calculation of Intersection Delay

EXPLANATION AND CALCULATION OF INTERSECTION LEVEL OF SERVICE USING DELAY METHODOLOGY

The levels of service at the unsignalized and signalized intersections are calculated using the delay methodology in the Highway Capacity Manual. This methodology views an intersection as consisting of several lane groups. A lane group is a set of lanes serving a movement. If there are two northbound left turn lanes, then the lane group serving the northbound left turn movement has two lanes. Similarly, there may be three lanes in the lane group serving the northbound through movement, one lane in the lane group serving the northbound right turn movement, and so forth. It is also possible for one lane to serve two lane groups. A shared lane might result in there being 1.5 lanes in the northbound left turn lane group and 2.5 lanes in the northbound through lane group.

For each lane group, there is a capacity. That capacity is calculated by multiplying the number of lanes in the lane group times a theoretical maximum lane capacity per lane time's 12 adjustment factors.

Each of the 12 adjustment factors has a value of approximately 1.00. A value less than 1.00 is generally assigned when a less than desirable condition occurs.

The 12 adjustment factors are as follows:

1. Peak hour factor (to account for peaking within the peak hour)
2. Lane utilization factor (to account for not all lanes loading equally)
3. Lane width
4. Percent of heavy trucks
5. Approach grade
6. Parking
7. Bus stops at intersections
8. Area type (CBD or other)
9. Right turns
10. Left turns

11. Pedestrian activity
12. Signal progression

The maximum theoretical lane capacity and the 12 adjustment factors for it are all unknowns for which approximate estimates have been recommended in the Highway Capacity Manual. For the most part, the recommended values are not based on statistical analysis but rather on educated estimates. However, it is possible to use the delay method and get reasonable results as will be discussed below.

Once the lane group volume is known and the lane group capacity is known, a volume to capacity ratio can be calculated for the lane group.

With a volume to capacity ratio calculated, average delay per vehicle in a lane group can be estimated. The average delay per vehicle in a lane group is calculated using a complex formula provided by the Highway Capacity Manual, which can be simplified and described as follows:

Delay per vehicle in a lane group is a function of the following:

1. Cycle length
2. Amount of red time faced by a lane group
3. Amount of yellow time for that lane group
4. The volume to capacity ratio of the lane group

The average delay per vehicle for each lane group is calculated, and eventually an overall average delay for all vehicles entering the intersection is calculated. This average delay per vehicle is then used to judge Level of Service. The Level of Services are defined in the table that follows this discussion.

Experience has shown that when a maximum lane capacity of 1,900 vehicles per hour is used (as recommended in the Highway Capacity Manual), little or no yellow time penalty is used, and none of the 12 penalty factors are applied, calculated delay is realistic. The delay calculation for instance assumes that yellow time is totally unused. Yet experience shows that most of the yellow time is used.

An idiosyncrasy of the delay methodology is that it is possible to add traffic to an intersection and reduce the average total delay per vehicle. If the average total delay is 30 seconds per vehicle for all vehicles traveling through an intersection, and traffic is added to a movement that has an average total delay of 15 seconds per vehicle, then the overall average total delay is reduced.

The delay calculation for a lane group is based on a concept that the delay is a function of the amount of unused capacity available. As the volume approaches capacity and there is no more unused capacity available, then the delay rapidly increases. Delay is not proportional to volume, but rather increases rapidly as the unused capacity approaches zero.

Because delay is not linearly related to volumes, the delay does not reflect how close an intersection is to overloading. If an intersection is operating at Level of Service C and has an average total delay of 18 seconds per vehicle, you know very little as to what percent the traffic can increase before Level of Service E is reached.

LEVEL OF SERVICE DESCRIPTION¹

Level Of Service	Description	Average Total Delay Per Vehicle (Seconds)	
		Signalized	Unsignalized
A	Level of Service A occurs when progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.	0 to 10.00	0 to 10.00
B	Level of Service B generally occurs with good progression and/or short cycle lengths. More vehicles stop than for Level of Service A, causing higher levels of average total delay.	10.01 to 20.00	10.01 to 15.00
C	Level of Service C generally results when there is fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear in this level. The number of vehicles stopping is significant at this level, although many still pass through the intersection without stopping.	20.01 to 35.00	15.01 to 25.00
D	Level of Service D generally results in noticeable congestion. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high volume to capacity ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.	35.01 to 55.00	25.01 to 35.00
E	Level of Service E is considered to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high volume to capacity ratios. Individual cycle failures are frequent occurrences.	55.01 to 80.00	35.01 to 50.00
F	Level of Service F is considered to be unacceptable to most drivers. This condition often occurs with oversaturation, i.e., when arrival flow rates exceed the capacity of the intersection. It may also occur at high volume to capacity ratios below 1.00 with many individual cycle failures. Poor progression and long cycle lengths may also be major contributing causes to such delay levels.	80.01 and up	50.01 and up

2000 HCM Operations Method (Future Volume Alternative)

Intersection #8 Valle Vista Road (NS) at Phelan Road (EW)

Cycle (sec): 95 Critical Vol./Cap.(X): 0.541
Loss Time (sec): 6 (Y+R=3.0 sec) Average Delay (sec/veh): 17.4
Optimal Cycle: OPTIMIZED Level Of Service: B

Table with 4 columns: Approach (North Bound, South Bound, East Bound, West Bound) and 3 sub-columns (L, T, R) for Movement, Control, Rights, Min. Green, and Lanes.

Volume Module: Table with 12 columns for various volume and adjustment factors like Base Vol, Growth Adj, Initial Bse, Added Vol, PasserByVol, Initial Fut, User Adj, PHF Adj, PHF Volume, Reduct Vol, Reduced Vol, PCE Adj, MLF Adj, FinalVolume.

Saturation Flow Module: Table with 12 columns for Sat/Lane, Adjustment, Lanes, and Final Sat.

Capacity Analysis Module: Table with 12 columns for Vol/Sat, Crit Moves, Green/Cycle, Volume/Cap, Delay/Veh, User DelAdj, AdjDel/Veh, LOS by Move, HCM2kAvgQ.

Note: Queue reported is the number of cars per lane.

Morning Peak Hour

Level Of Service Computation Report

2000 HCM Unsignalized Method (Future Volume Alternative)

Intersection #9 Valle Vista Road (NS) at Project Driveway (EW)

Average Delay (sec/veh): 3.6 Worst Case Level Of Service: A[9.9]

Table with 4 columns: North Bound, South Bound, East Bound, West Bound. Rows include Movement, Control, Rights, and Lanes.

Volume Module: Table with 13 columns representing different traffic volumes and adjustment factors.

Critical Gap Module: Table with 13 columns showing critical gap and follow-up time values.

Capacity Module: Table with 13 columns showing conflict volume, capacity, and volume/capacity ratios.

Level Of Service Module: Table with 13 columns showing delay, LOS, and queue length for different movements.

Note: Queue reported is the number of cars per lane.

APPENDIX I

**Highway Design Manual
Sight Distance Standards**

CHAPTER 200 GEOMETRIC DESIGN AND STRUCTURE STANDARDS

Topic 201 - Sight Distance

Index 201.1 - General

Sight distance is the continuous length of highway ahead, visible to the highway user. Four types of sight distance are considered herein: passing, stopping, decision, and corner. Passing sight distance is used where use of an opposing lane can provide passing opportunities (see Index 201.2). Stopping sight distance is the minimum sight distance for a given design speed to be provided on multilane highways and on 2-lane roads when passing sight distance is not economically obtainable. Stopping sight distance also is to be provided for all users, including motorists and bicyclists, at all elements of interchanges and intersections at grade, including private road connections (see Topic 504, Index 405.1, & Figure 405.7). Decision sight distance is used at major decision points (see Indexes 201.7 and 504.2). Corner sight distance is used at intersections (see Index 405.1, Figure 405.7, and Figure 504.3J).

Table 201.1 shows the minimum standards for stopping sight distance related to design speed for motorists. Stopping sight distances given in the table are suitable for Class II and Class III bikeways. The stopping sight distances are also applicable to roundabout design on the approach roadway, within the circulatory roadway, and on the exits prior to the pedestrian crossings. Also shown in Table 201.1 are the values for use in providing passing sight distance.

See Chapter 1000 for Class I bikeway sight distance guidance.

Chapter 3 of "A Policy on Geometric Design of Highways and Streets," AASHTO, contains a thorough discussion of the derivation of stopping sight distance.

201.2 Passing Sight Distance

Passing sight distance is the minimum sight distance required for the driver of one vehicle to pass another vehicle safely and comfortably.

Passing must be accomplished assuming an oncoming vehicle comes into view and maintains the design speed, without reduction, after the overtaking maneuver is started.

**Table 201.1
Sight Distance Standards**

Design Speed ⁽¹⁾ (mph)	Stopping ⁽²⁾ (ft)	Passing (ft)
10	50	---
15	100	---
20	125	800
25	150	950
30	200	1,100
35	250	1,300
40	300	1,500
45	360	1,650
50	430	1,800
55	500	1,950
60	580	2,100
65	660	2,300
70	750	2,500
75	840	2,600
80	930	2,700

(1) See Topic 101 for selection of design speed.

(2) For sustained downgrades, refer to advisory standard in Index 201.3

The sight distance available for passing at any place is the longest distance at which a driver whose eyes are 3 ½ feet above the pavement surface can see the top of an object 4 ¼ feet high on the road. See Table 201.1 for the calculated values that are associated with various design speeds.

In general, 2-lane highways should be designed to provide for passing where possible, especially those routes with high volumes of trucks or recreational vehicles. Passing should be done on tangent horizontal alignments with constant grades or a slight sag vertical curve. Not only are drivers reluctant to pass on a long crest vertical curve, but it is impracticable to design crest vertical curves to provide for passing sight distance because of high

cost where crest cuts are involved. Passing sight distance for crest vertical curves is 7 to 17 times longer than the stopping sight distance.

Ordinarily, passing sight distance is provided at locations where combinations of alignment and profile do not require the use of crest vertical curves.

Passing sight distance is considered only on 2-lane roads. At critical locations, a stretch of 3- or 4-lane passing section with stopping sight distance is sometimes more economical than two lanes with passing sight distance.

Passing on sag vertical curves can be accomplished both day and night because headlights can be seen through the entire curve.

See Part 3 of the California Manual on Uniform Traffic Control Devices (California MUTCD) for criteria relating to the placement of barrier striping for no-passing zones. Note, that the passing sight distances shown in the California MUTCD are based on traffic operational criteria. Traffic operational criteria are different from the design characteristics used to develop the values provided in Table 201.1 and Chapter 3 of AASHTO, A Policy on Geometric Design of Highways and Streets. The aforementioned table and AASHTO reference are also used to design the vertical profile and horizontal alignment of the highway. Consult the Headquarters (HQ) Traffic Liaison when using the California MUTCD criteria for traffic operating-control needs.

Other means for providing passing opportunities, such as climbing lanes or turnouts, are discussed in Index 204.5. Chapter 3 of AASHTO, A Policy on Geometric Design of Highways and Streets, contains a thorough discussion of the derivation of passing sight distance.

201.3 Stopping Sight Distance

The minimum stopping sight distance is the distance required by the user, traveling at a given speed, to bring the vehicle or bicycle to a stop after an object ½-foot high on the road becomes visible. Stopping sight distance for motorists is measured from the driver's eyes, which are assumed to be 3 ½ feet above the pavement surface, to an object ½-foot high on the road. See Index 1003.1(10) for Class I bikeway stopping sight distance guidance.

The stopping sight distances in Table 201.1 should be increased by 20 percent on sustained downgrades steeper than 3 percent and longer than one mile.

201.4 Stopping Sight Distance at Grade Crests

Figure 201.4 shows graphically the relationships between length of highway crest vertical curve, design speed, and algebraic difference in grades. Any one factor can be determined when the other two are known.

201.5 Stopping Sight Distance at Grade Sags

From the curves in Figure 201.5, the minimum length of vertical curve which provides headlight sight distance in grade sags for a given design speed can be obtained.

If headlight sight distance is not obtainable at grade sags, lighting may be considered. The Design Coordinator and the HQ Traffic Liaison shall be contacted to review proposed grade sag lighting to determine if such use is appropriate.

201.6 Stopping Sight Distance on Horizontal Curves

Where an object off the pavement such as a bridge pier, building, cut slope, or natural growth restricts sight distance, the minimum radius of curvature is determined by the stopping sight distance.

Available stopping sight distance on horizontal curves is obtained from Figure 201.6. It is assumed that the driver's eye is 3 ½ feet above the center of the inside lane (inside with respect to curve) and the object is ½-foot high. The line of sight is assumed to intercept the view obstruction at the midpoint of the sight line and 2 feet above the center of the inside lane when the road profile is flat (i.e. no vertical curve). Crest vertical curves can cause additional reductions in sight distance. The clear distance (*m*) is measured from the center of the inside lane to the obstruction.

The design objective is to determine the required clear distance from centerline of inside lane to a retaining wall, bridge pier, abutment, cut slope, or other obstruction for a given design speed. Using radius of curvature and minimum sight distance for that design speed, Figure 201.6 gives the clear

distance (m) from centerline of inside lane to the obstruction.

See Index 1003.1(12) for bikeway stopping sight distance on horizontal curve guidance.

When the radius of curvature and the clear distance to a fixed obstruction are known, Figure 201.6 also gives the sight distance for these conditions.

See Index 101.1 for technical reductions in design speed caused by partial or momentary horizontal sight distance restrictions. See Index 203.2 for additional comments on glare screens.

Cuts may be widened where vegetation restricting horizontal sight distance is expected to grow on finished slopes. Widening is an economic trade-off that must be evaluated along with other options. See Index 902.2 for sight distance requirements on landscape projects.

201.7 Decision Sight Distance

At certain locations, sight distance greater than stopping sight distance is desirable to allow drivers time for decisions without making last minute erratic maneuvers (see Chapter III of AASHTO, A Policy on Geometric Design of Highways and Streets, for a thorough discussion of the derivation of decision sight distance.)

On freeways and expressways the decision sight distance values in Table 201.7 should be used at lane drops and at off-ramp noses to interchanges, branch connections, roadside rests, vista points, and inspection stations. When determining decision sight distance on horizontal and vertical curves, Figures 201.4, 201.5, and 201.6 can be used. Figure 201.7 is an expanded version of Figure 201.4 and gives the relationship among length of crest vertical curve, design speed, and algebraic difference in grades for much longer vertical curves than Figure 201.4.

Decision sight distance is measured using the 3 ½-foot eye height and ½-foot object height. See Index 504.2 for sight distance at secondary exits on a collector-distributor road.

Table 201.7
Decision Sight Distance

Design Speed (mph)	Decision Sight Distance (ft)
30	450
35	525

45	675
50	750
55	865
60	990
65	1,050
70	1,105
75	1,180
80	1,260

Topic 202 - Superelevation

202.1 Basic Criteria

According to the laws of mechanics, when a vehicle travels on a curve it is forced outward by centrifugal force.

On a superelevated highway, this force is resisted by the vehicle weight component parallel to the superelevated surface and side friction between the tires and pavement. It is impractical to balance centrifugal force by superelevation alone, because for any given curve radius a certain superelevation rate is exactly correct for only one driving speed. At all other speeds there will be a side thrust either outward or inward, relative to the curve center, which must be offset by side friction.

If the vehicle is not skidding, these forces are in equilibrium as represented by the following equation, which is used to design a curve for a comfortable operation at a particular speed:

$$\text{Centrifugal Factor} = e + f = \frac{0.067V^2}{R} = \frac{V^2}{15R}$$

Figure 201.4
Stopping Sight Distance on Crest Vertical Curves

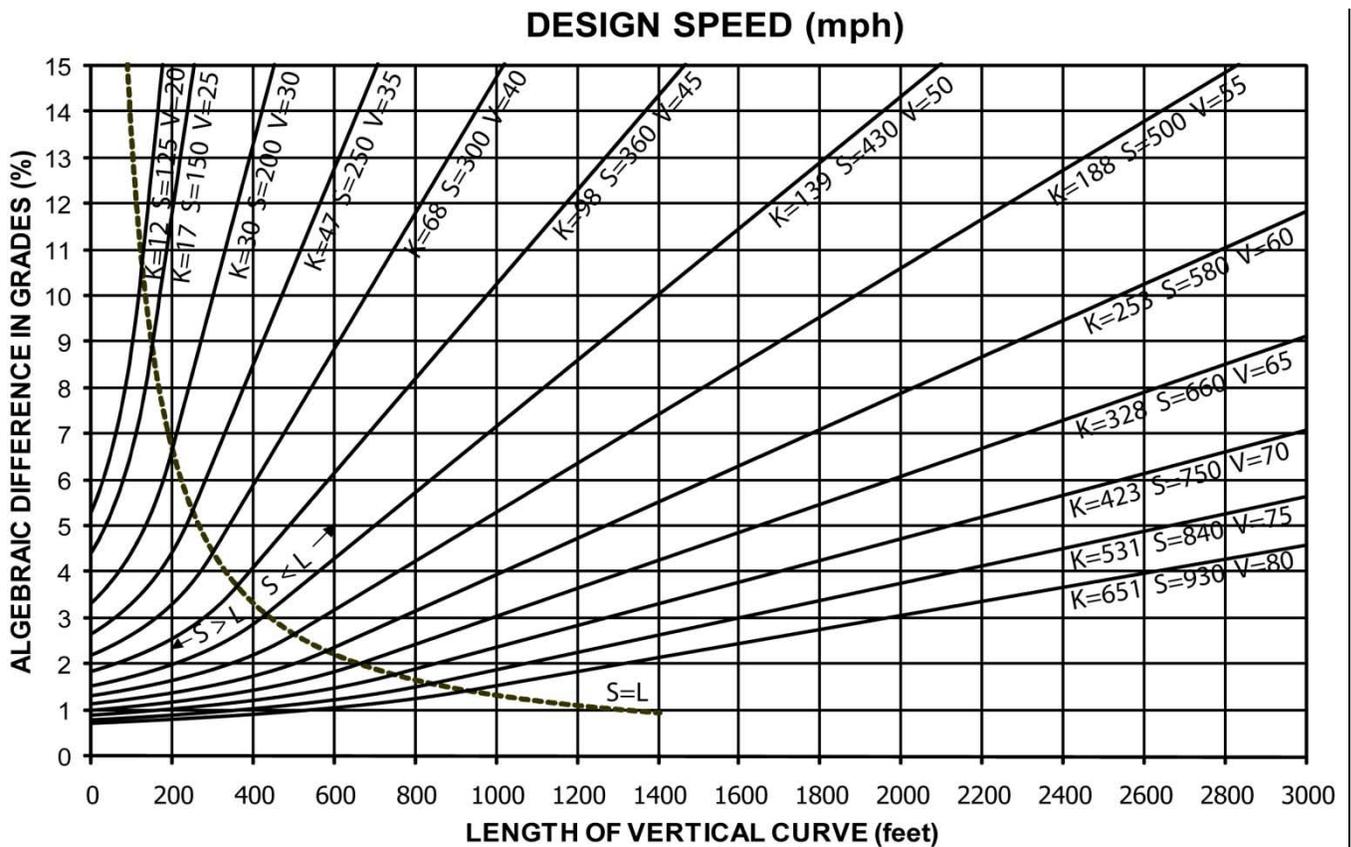

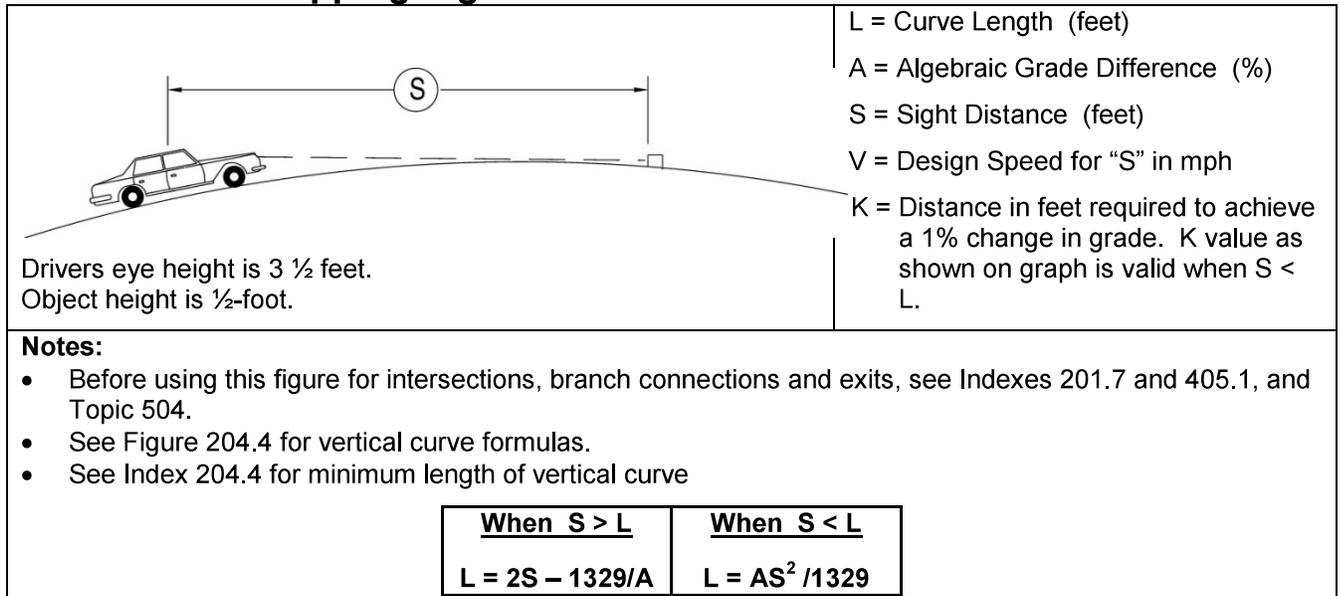

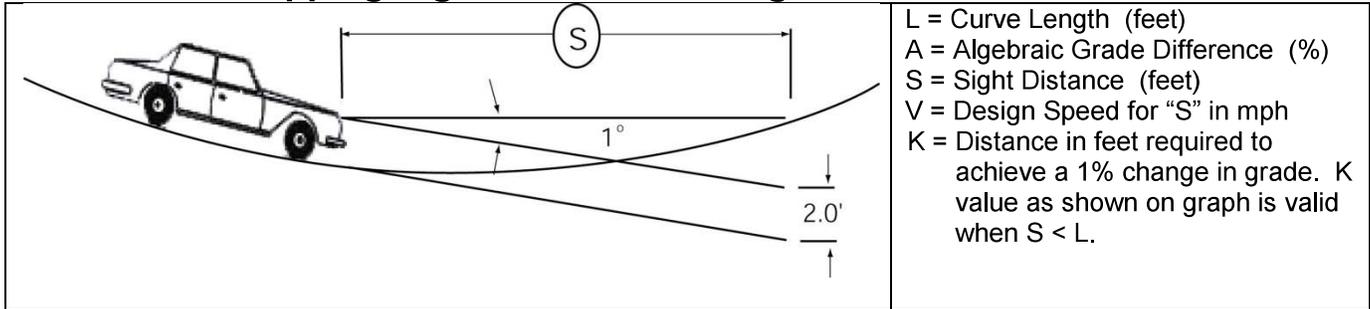

Figure 201.5
Stopping Sight Distance on Sag Vertical Curves

Notes:

- For sustained downgrades, see Index 201.3.
- Before using this figure for intersections, branch connections and exits, see Indexes 201.7 and 405.1, and Topic 504.
- See Figure 204.4 for vertical curve formulas.
- See Index 204.4 for minimum length of vertical curve.

When $S > L$	When $S < L$
$L = 2S - (400 + 3.5S)/A$	$L = AS^2 / (400 + 3.5S)$

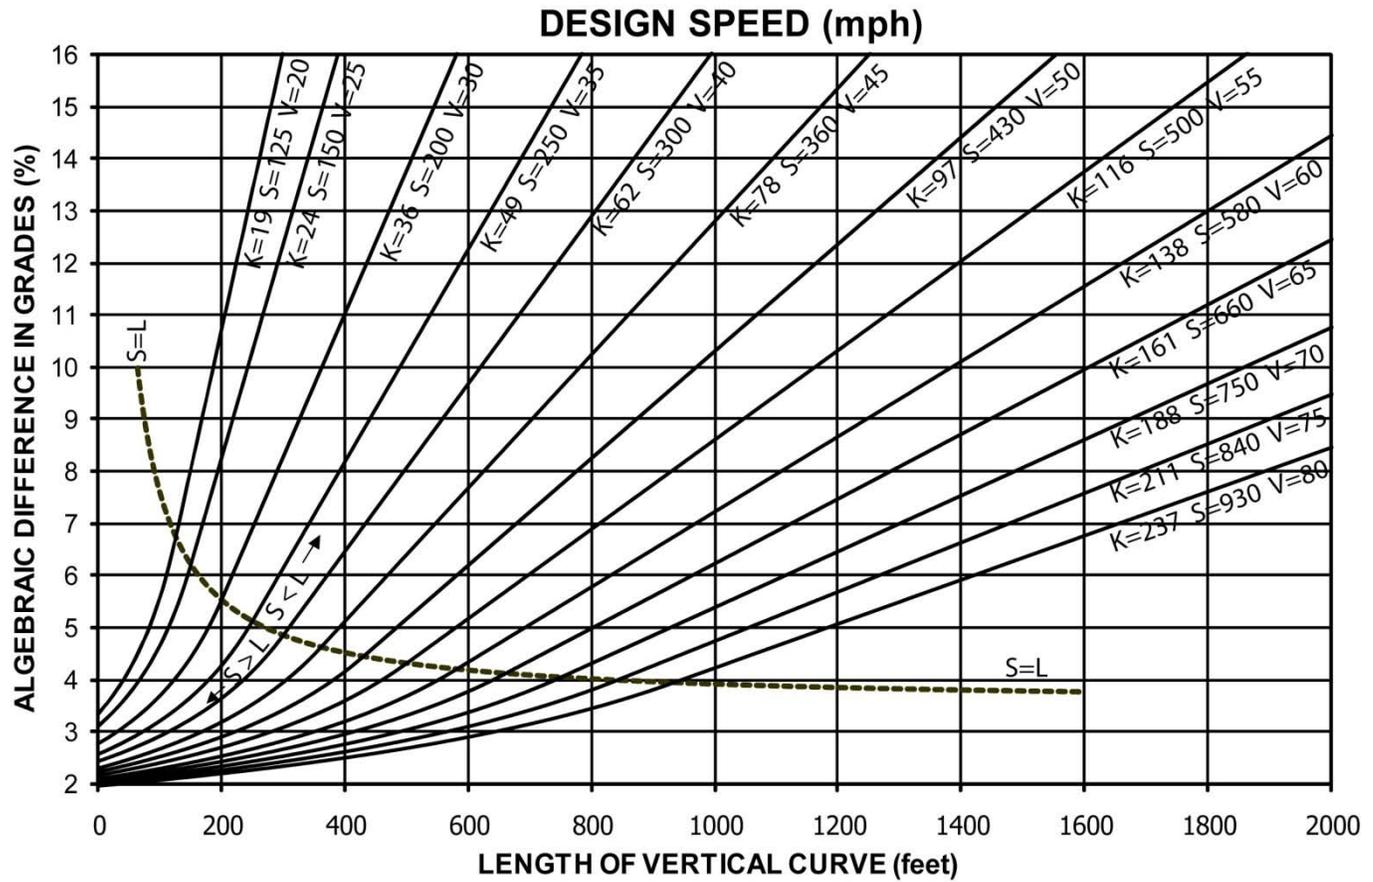

Figure 201.6
Stopping Sight Distance on Horizontal Curves

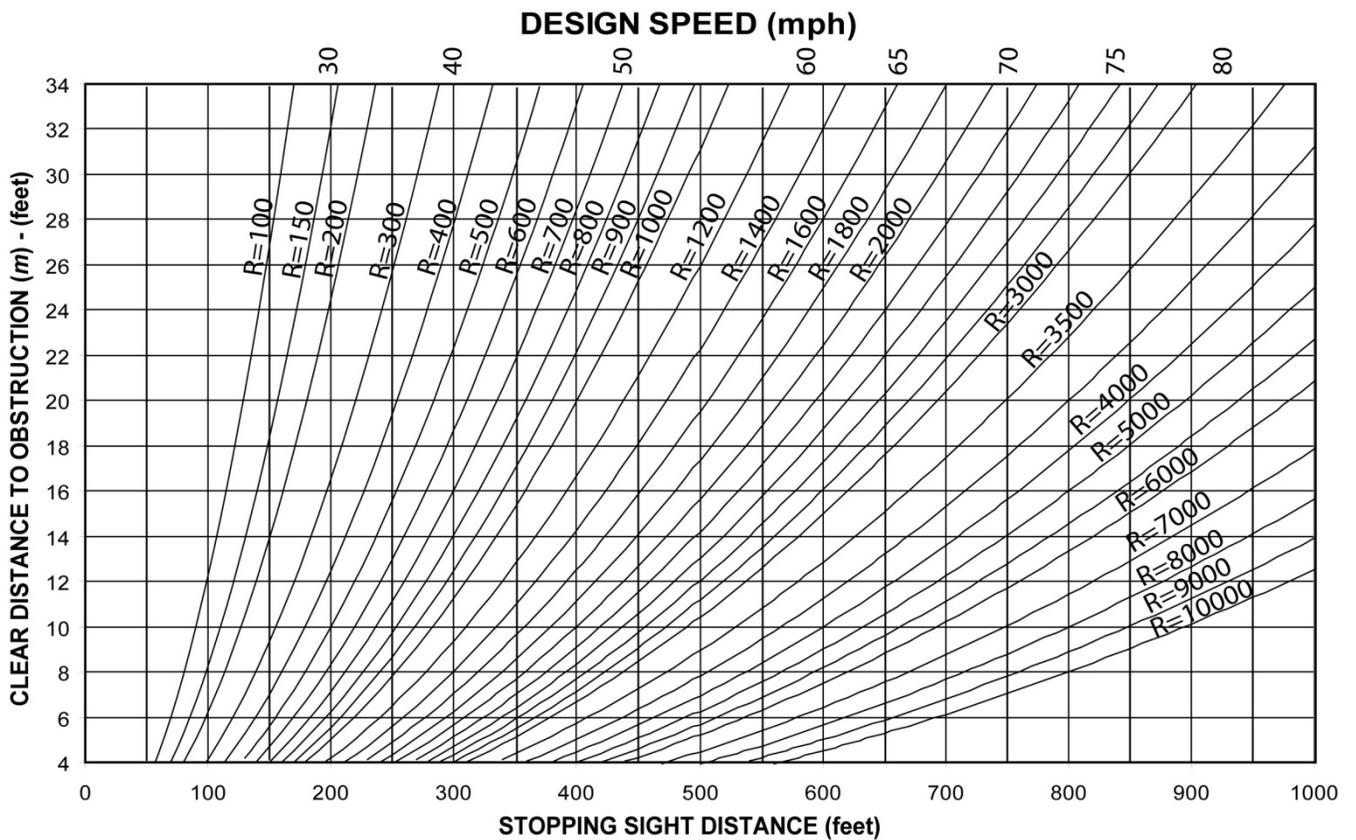

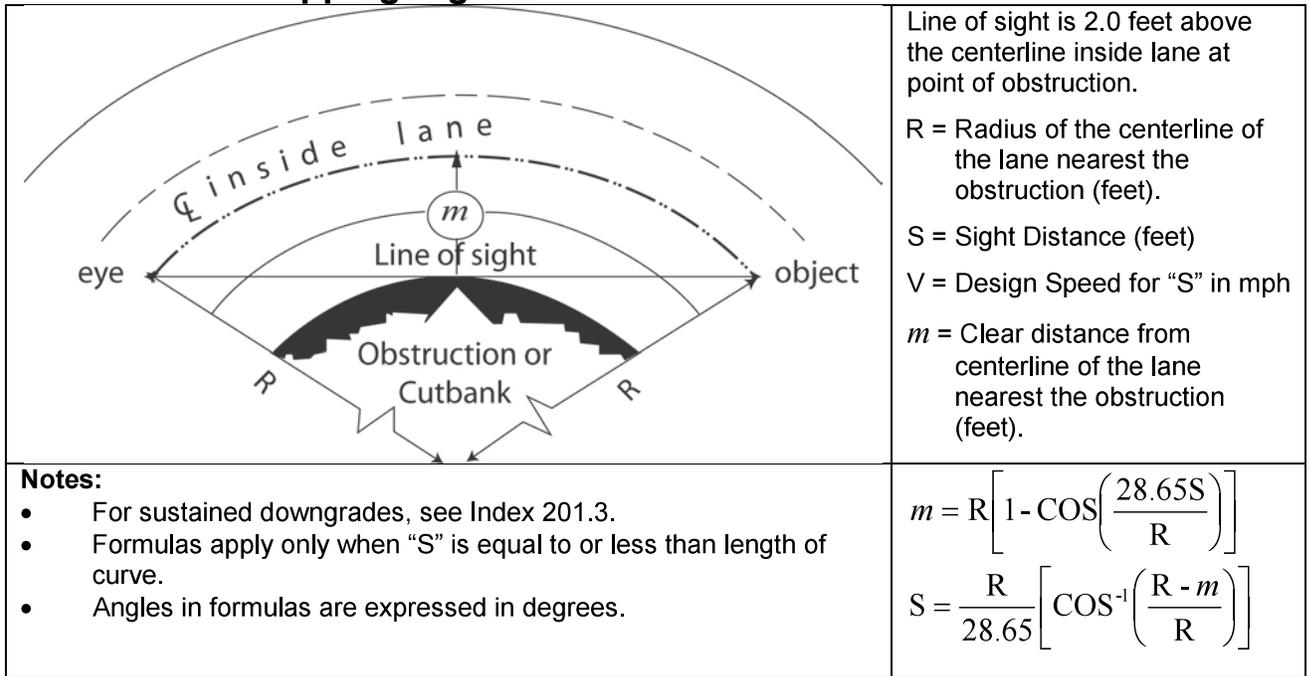

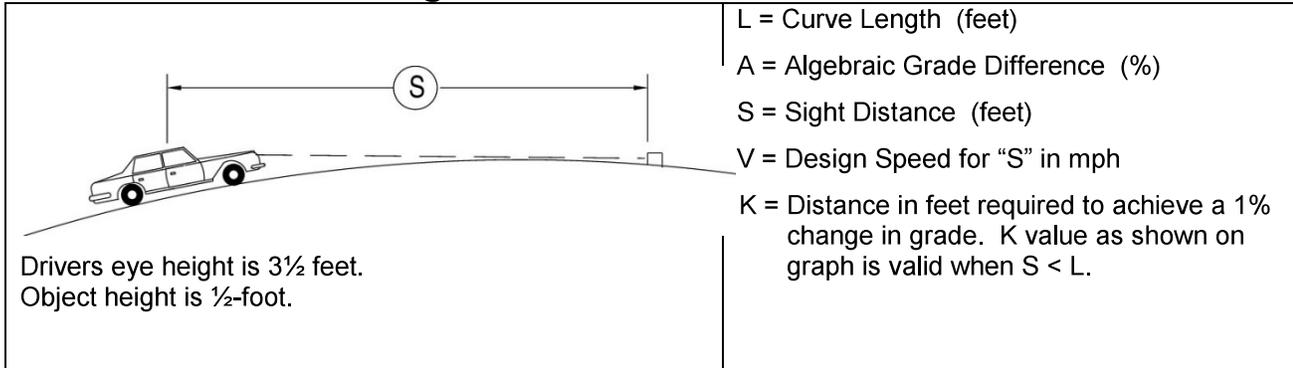

Figure 201.7
Decision Sight Distance on Crest Vertical Curves

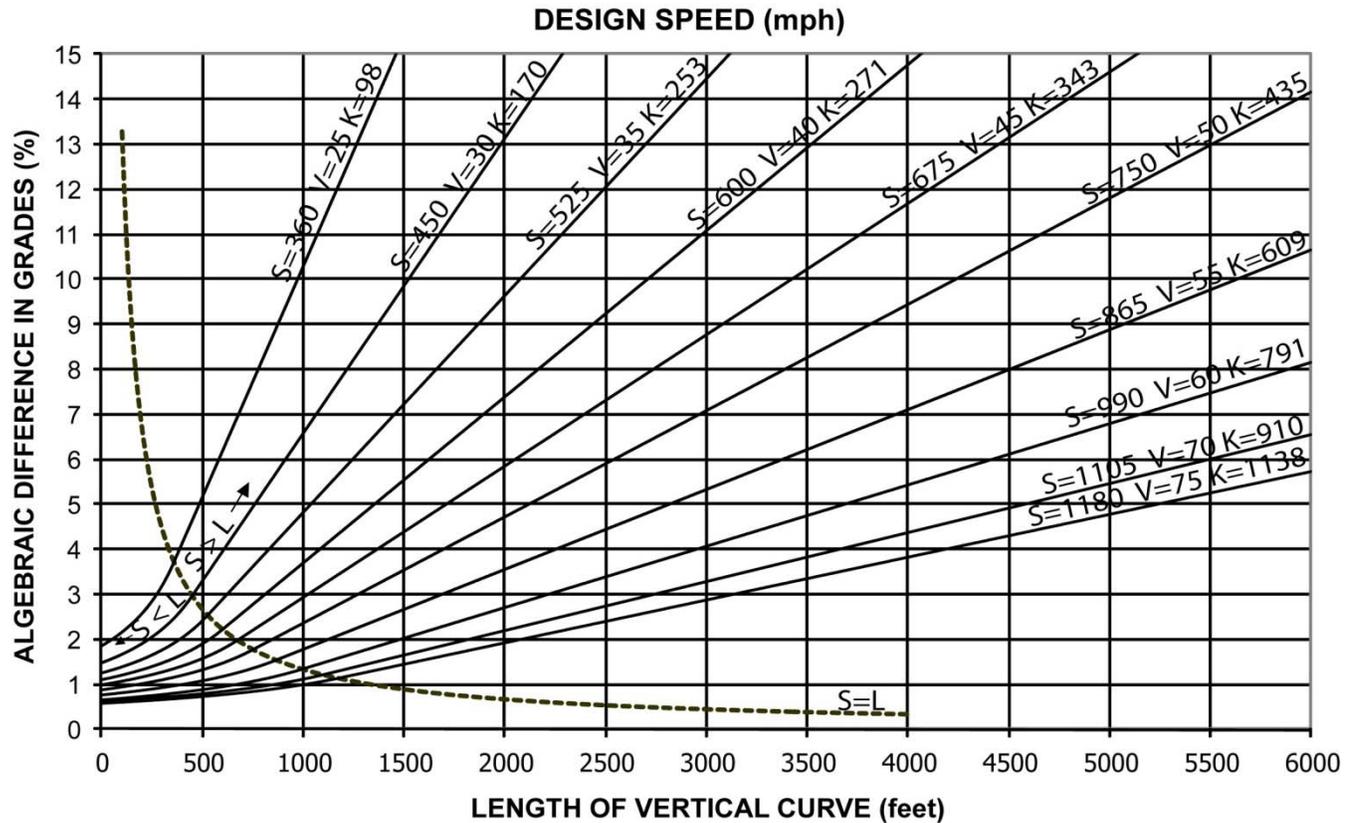

Drivers eye height is 3½ feet.
 Object height is ½-foot.

L = Curve Length (feet)
 A = Algebraic Grade Difference (%)
 S = Sight Distance (feet)
 V = Design Speed for "S" in mph
 K = Distance in feet required to achieve a 1% change in grade. K value as shown on graph is valid when S < L.

Notes:

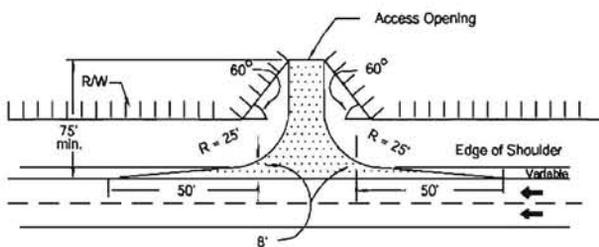

- Before using this figure for intersections, branch connections and exits, see Indexes 201.7 and 405.1, and Topic 504.
- See Figure 204.4 for vertical curve formulas.
- See Index 204.4 for minimum length of vertical curve.

<u>When S > L</u>	<u>When S < L</u>
$L = 2S - 1329/A$	$L = AS^2 / 1329$

- (3) *Recessed Access Openings.* Recessed access openings, as shown on Figure 205.1, are desirable at all points where private access is permitted and should be provided whenever they can be obtained without requiring alterations to existing adjacent improvements. When recessed openings are required, the opening should be located a minimum distance of 75 feet from the nearest edge of the traveled way.
- (4) *Joint Openings.* A joint access opening serving two or more parcels of land is desirable whenever feasible. If the property line is not normal to the right of way line, care should be taken in designing the joint opening so that both owners are adequately served.
- (5) *Surfacing.* All points of private access should be surfaced with adequate width and depth of pavement to serve the anticipated traffic. The surfacing should extend from the edge of the traveled way to the right of way line.

Figure 205.1
Access Openings on
Expressways

RECESSED OPENING

NOTES:

- By widening the expressway shoulder, deceleration lanes may be provided where justified.
- This detail, without the recess, may be used on conventional highways.

205.2 Private Road Connections

The minimum private road connection design is shown on Figure 205.1. Sight distance requirements for the minimum private road

connection are shown on Figure 405.7 (see Index 405.1(2)(c)).

205.3 Urban Driveways

These instructions apply to the design of driveways to serve property abutting on State highways in cities or where urban type development is encountered.

Details for driveway construction are shown on the Standard Plans. Corner sight distance requirements are not applied to urban driveways. See Index 405.1(2) for further information.

- (1) *Correlation with Local Standards.* Where there is a local requirement regulating driveway construction, the higher standard will normally govern.
- (2) *Driveway Width.* The width of driveways for both residential and commercial usage is measured at the throat, exclusive of any flares. ("W" as shown in Standard Plan A87A).
- (3) *Residential Driveways.* The width of single residential driveways should be 12 feet minimum and 20 feet maximum. The width of a double residential driveway such as used for multiple dwellings should be 20 feet minimum and 30 feet maximum. The width selected should be based on an analysis of the anticipated volume, type and speed of traffic, location of buildings and garages, width of street, etc.
- (4) *Commercial Driveways.* Commercial driveways should be limited to the following maximum widths:
 - (a) When the driveway is used for one-way traffic, the maximum width should be 25 feet. If the driveway serves a large parcel, where large volumes of vehicles or large vehicles are expected, the entrance maximum width should be 40 feet and the exit maximum width should be 35 feet.
 - (b) When the driveway is used for two-way traffic, the maximum width should be 35 feet. If the driveway serves a large parcel, where large volumes of vehicles or

large vehicles are expected, then the maximum width should be 45 feet.

- (c) When only one driveway serves a given property, in no case should the width of the driveway including the side slope distances exceed the property frontage.
 - (d) When more than one driveway is to serve a given property, the total width of all driveways should not exceed 70 percent of the frontage where such a frontage is 100 feet or less. Where the frontage is more than 100 feet, the total driveway width should not exceed 60 percent of the frontage. In either case, the width of the individual driveway should not exceed those given in the preceding paragraphs. Where more than one driveway is necessary to serve any one property, not less than 20 feet of full height curb should be provided between driveways. This distance between driveways also applies to projects where curbs and gutters are not to be placed.
 - (e) Certain urban commercial driveways may need to accommodate the maximum legal vehicle. The width will be determined by the use of truck turn templates.
- (5) *Surfacing.* Where curbs, gutters, and sidewalks are to be placed, driveways should be constructed of portland cement concrete. Where only curbs and gutters are to be placed and pedestrian traffic or adjacent improvements do not warrant concrete driveway construction, the driveway may be paved with the same materials used for existing surfacing on the property to be served.
- (6) *Pedestrian Access.* Where sidewalks traverse driveways, the sidewalk shall continue across the driveway to alert driveway users that they are crossing a pedestrian walkway, and must yield to pedestrians on the sidewalk. Driveway corner radii should also be minimized to encourage low-speed turns by motorized vehicles and bicycles. For accessibility requirements, see DIB 82. Provision of this feature, as indicated in the

Standard Plans, may require the acquisition of a construction easement or additional right of way. Assessment of these needs must be performed early enough in the design to allow time for acquiring any necessary permits or right of way. Additionally, designers should consider the following:

- In many cases providing the pathway along the back of the driveway will lower the elevation at the back of the sidewalk. Depending on grades behind the sidewalk the potential may exist for roadway generated runoff to enter private property. The need for features such as low berms within the construction easement, or installation of catch basins upstream of the driveway should be determined.

When there are no sidewalks or other pedestrian facilities that follow the highway, the designer may develop driveway details that eliminate the flatter portion along the back edge in lieu of using the Standard Plans for driveways. Refer to Topic 105 for additional information related to pedestrian facilities.

205.4 Driveways on Frontage Roads and in Rural Areas

On frontage roads and in rural areas where the maximum legal vehicle must be accommodated, standard truck-turn templates should be used to determine driveway widths where the curb or edge of traveled way is so close to the right of way line that a usable connection cannot be provided within the standard limits.

Where county or city regulations differ from the State's, it may be desirable to follow their regulations, particularly where jurisdiction of the frontage road will ultimately be in their hands.

Details for driveway construction are shown on the Standard Plans. For corner sight distance, see Index 405.1(2)(c).

Driveways connecting to State highways shall be paved a minimum of 33 feet or to the edge of State right of way, whichever is less to minimize or eliminate gravel from being scattered on the highway and to provide a good surface for vehicles

404.5 Turning Templates & Vehicle Diagrams

Figures 404.5A through G are computer-generated turning templates at an approximate scale of 1"=50' and their associated vehicle diagrams for the design vehicles described in Index 404.3. The radius of the template is measured to the outside front wheel path at the beginning of the curve. Figures 404.5A through G contain the terms defined as follows:

- (1) *Tractor Width* - Width of tractor body.
- (2) *Trailer Width* - Width of semitrailer body.
- (3) *Tractor Track* - Tractor axle width, measured from outside face of tires.
- (4) *Trailer Track* - Semitrailer axle width, measured from outside face of tires.
- (5) *Lock To Lock Time* - The time in seconds that an average driver would take under normal driving conditions to turn the steering wheel of a vehicle from the lock position on one side to the lock position on the other side. The default in AutoTurn software is 6 seconds.
- (6) *Steering Lock Angle* - The maximum angle that the steering wheels can be turned. It is further defined as the average of the maximum angles made by the left and right steering wheels with the longitudinal axis of the vehicle.
- (7) *Articulating Angle* - The maximum angle between the tractor and semitrailer.

Topic 405 - Intersection Design Standards

405.1 Sight Distance

- (1) *Stopping Sight Distance*. See Index 201.1 for minimum stopping sight distance requirements.
- (2) *Corner Sight Distance*.
 - (a) General--At unsignalized intersections a substantially clear line of sight should be maintained between the driver of a vehicle, bicyclist or pedestrian waiting at the crossroad and the driver of an approaching vehicle. Line of sight for all users should be included in right of way, in order to preserve sight lines.

Adequate time must be provided for the waiting user to either cross all lanes of through traffic, cross the near lanes and turn left, or turn right, without requiring through traffic to radically alter their speed.

The values given in Table 405.1A provide 7-1/2 seconds for the driver on the crossroad to complete the necessary maneuver while the approaching vehicle travels at the assumed design speed of the main highway. The 7-1/2 second criterion is normally applied to all lanes of through traffic in order to cover all possible maneuvers by the vehicle at the crossroad. However, by providing the standard corner sight distance to the lane nearest to and farthest from the waiting vehicle, adequate time should be obtained to make the necessary movement. On multilane highways a 7-1/2 second criterion for the outside lane, in both directions of travel, normally will provide increased sight distance to the inside lanes. Consideration should be given to increasing these values on downgrades steeper than 3 percent and longer than 1 mile (see Index 201.3), where there are high truck volumes on the crossroad, or where the skew of the intersection substantially increases the distance traveled by the crossing vehicle.

In determining corner sight distance, a set back distance for the vehicle waiting at the crossroad must be assumed. **Set back for the driver of the vehicle on the crossroad shall be a minimum of 10 feet plus the shoulder width of the major road but not less than 15 feet.** Line of sight for corner sight distance is to be determined from a 3 and 1/2-foot height at the location of the driver of the vehicle on the minor road to a 4 and 1/4-foot object height in the center of the approaching lane of the major road as illustrated in Figure 504.3J. If the major road has a median barrier, a 2-foot object height should be used to determine the median barrier set back.

In some cases the cost to obtain 7-1/2 seconds of corner sight distances

may be excessive. High costs may be attributable to right of way acquisition, building removal, extensive excavation, or inmitigable environmental impacts. In such cases a lesser value of corner sight distance, as described under the following headings, may be used.

- (b) Public Road Intersections (Refer to Topic 205)--At unsignalized public road intersections (see Index 405.7) corner sight distance values given in Table 405.1A should be provided.

At signalized intersections the values for corner sight distances given in Table 405.1A should also be applied whenever possible. Even though traffic flows are designed to move at separate times, unanticipated conflicts can occur due to violation of signal, right turns on red, malfunction of the signal, or use of flashing red/yellow mode.

**Table 405.1A
Corner Sight Distance
(7-1/2 Second Criteria)**

Design Speed (mph)	Corner Sight Distance (ft)
25	275
30	330
35	385
40	440
45	495
50	550
55	605
60	660
65	715
70	770

Where restrictive conditions exist, similar to those listed in Index 405.1(2)(a), the minimum value for corner sight distance at both signalized and unsignalized intersections shall be equal to the stopping sight distance as given in Table 201.1, measured as previously described.

- (c) Private Road Intersections (Refer to Index 205.2) and Rural Driveways (Refer to Index 205.4)--**The minimum corner sight distance shall be equal to the stopping sight distance as given in Table 201.1, measured as previously described.**

- (d) Urban Driveways (Refer to Index 205.3)--Corner sight distance requirements as described above are not applied to urban driveways.

- (3) *Decision Sight Distance.* At intersections where the State route turns or crosses another State route, the decision sight distance values given in Table 201.7 should be used. In computing and measuring decision sight distance, the 3.5-foot eye height and the 0.5-foot object height should be used, the object being located on the side of the intersection nearest the approaching driver.

The application of the various sight distance requirements for the different types of intersections is summarized in Table 405.1B.

- (4) *Acceleration Lanes for Turning Moves onto State Highways.* At rural intersections, with "STOP" control on the local cross road, acceleration lanes for left and right turns onto the State facility should be considered. At a minimum, the following features should be evaluated for both the major highway and the cross road:

- divided versus undivided
- number of lanes
- design speed
- gradient
- lane, shoulder and median width
- traffic volume and composition of highway users, including trucks and transit vehicles
- turning volumes
- horizontal curve radii
- sight distance
- proximity of adjacent intersections
- types of adjacent intersections

For additional information and guidance, refer to AASHTO, A Policy on Geometric Design of Highways and Streets, the Headquarters Traffic Liaison and the Design Coordinator.

**Table 405.1B
Application of Sight Distance
Requirements**

Intersection Types	Sight Distance		
	Stopping	Corner	Decision
Private Roads	X	X ⁽¹⁾	
Public Streets and Roads	X	X	
Signalized Intersections	X	(2)	
State Route Inter- sections & Route Direction Changes, with or without Signals	X	X	X

NOTES:

- (1) Using stopping sight distance between an eye height of 3.5 ft and an object height of 4.25 ft. See Index 405.1(2)(a) for setback requirements.
- (2) Apply corner sight distance requirements at signalized intersections whenever possible due to unanticipated violations of the signals or malfunctions of the signals. See Index 405.1(2)(b).

405.2 Left-turn Channelization

- (1) *General.* The purpose of a left-turn lane is to expedite the movement of through traffic by, controlling the movement of turning traffic, increasing the capacity of the intersection, and improving safety characteristics.

The District Traffic Branch normally establishes the need for left-turn lanes.

- (2) *Design Elements.*

- (a) Lane Width – **The lane width for both single and double left-turn lanes on State highways shall be 12 feet.**

For conventional State highways with posted speeds less than or equal to 40 miles per hour and AADTT (truck

volume) less than 250 per lane that are in urban, city or town centers (rural main streets), the minimum lane width shall be 11 feet.

When considering lane width reductions adjacent to curbed medians, refer to Index 303.5 for guidance on effective roadway width, which may vary depending on drivers’ lateral positioning and shy distance from raised curbs.

- (b) Approach Taper -- On conventional highways without a median, an approach taper provides space for a left-turn lane by moving traffic laterally to the right. The approach taper is unnecessary where a median is available for the full width of the left-turn lane. Length of the approach taper is given by the formula on Figures 405.2A, B and C.

Figure 405.2A shows a standard left-turn channelization design in which all widening is to the right of approaching traffic and the deceleration lane (see below) begins at the end of the approach taper. This design should be used in all situations where space is available, usually in rural and semi-rural areas or in urban areas with high traffic speeds and/or volumes.

Figures 405.2B and 405.2C show alternate designs foreshortened with the deceleration lane beginning at the 2/3 point of the approach taper so that part of the deceleration takes place in the through traffic lane. Figure 405.2C is shortened further by widening half (or other appropriate fraction) on each side. These designs may be used in urban areas where constraints exist, speeds are moderate and traffic volumes are relatively low.

- (c) Bay Taper -- A reversing curve along the left edge of the traveled way directs traffic into the left-turn lane. The length of this bay taper should be short to clearly delineate the left-turn move and to discourage through traffic from drifting into the left-turn lane. Table 405.2A gives offset data for design of bay tapers. In urban areas,

405.7 Public Road Intersections

The basic design to be used at right-angle public road intersections on the State Highway System is shown in Figure 405.7. The essential elements are sight distance (see Index 405.1) and the treatment of the right-turn on and off the main highway. Encroachment into opposing traffic lanes by the turning vehicle should be avoided or minimized.

- (1) *Right-turn Onto the Main Highway.* The combination of a circular curve joined by a 2:1 taper on the crossroads and a 75-foot taper on the main highway is designed to fit the wheel paths of the appropriate turning template chosen by the designer.

It is desirable to keep the right-turn as tight as practical, so the “STOP” or “YIELD” sign on the minor leg can be placed close to the intersection.

- (2) *Right-turn Off the Main Highway.* The combination of a circular curve joined by a 150-foot taper on the main highway and a 4:1 taper on the crossroads is designed to fit the wheel paths of the appropriate turning template and to move the rear of the vehicle off the main highway. Deceleration and storage lanes may be provided when necessary (see Index 405.3).

- (3) *Alternate Designs.* Offsets are given in Figure 405.7 for right angle intersections. For skew angles, roadway curvature, and possibly other reasons, variations to the right-angle design are permitted, but the basic rule is still to approximate the wheel paths of the design vehicle.

A three-center curve is an alternate treatment that may be used at the discretion of the designer.

Intersections are major consideration in bicycle path design as well. See Indexes 403.6 and 1003.1(4) for general bicycle path intersection design guidance. Also see Section 5.3 of the AASHTO Guide for the Planning, Design, and Operation of Bicycle Facilities.

405.8 City Street Returns and Corner Radii

The pavement width and corner radius at city street intersections is determined by the type of vehicle to

be accommodated and the mobility needs of pedestrians and bicyclists, taking into consideration the amount of available right of way, the types of adjoining land uses, the place types, the roadway width, and the number of lanes on the intersecting street.

At urban intersections, the California truck or the Bus Design Vehicle template may be used to determine the corner radius. Where STAA truck access is allowed, the STAA Design Vehicle template should be used giving consideration to factors mentioned above. See Index 404.3.

Smaller radii of 15 feet to 25 feet are appropriate at minor cross streets where few trucks or buses are turning. Local agency standards may be appropriate in urban and suburban areas.

Encroachment into opposing traffic lanes must be avoided.

405.9 Widening of 2-lane Roads at Signalized Intersections

Two-lane State highways may be widened at intersections to 4-lanes whenever signals are installed. Sometimes it may be necessary to widen the intersecting road. The minimum design is shown in Figure 405.9. More elaborate treatment may be warranted by the volume and pattern of traffic movements. Unusual turning movement patterns may possibly call for a different shape of widening.

The impact on pedestrian and bicycle traffic mobility of larger intersections should be assessed before a decision is made to widen an intersection.

405.10 Roundabouts

Roundabout intersections on the State highway system must be developed and evaluated in accordance with National Cooperative Highway Research Program (NCHRP) Report 672 entitled “Roundabouts: An Informational Guide, 2nd ed.” (NCHRP Guide 2) dated October 2010 and Traffic Operations Policy Directive (TOPD) Number 13-02. Also see Index 401.5 for general information and guidance. See Figure 405.10 Roundabout Geometric Elements for nomenclature associated with roundabouts. Signs, striping and markings at roundabouts are to comply with the California MUTCD.

APPENDIX J
